

HP60 - HP65 - HP72

Gas / light oil dual fuel burners Progressive - Fully modulating

MANUAL OF INSTALLATION - USE - MAINTENANCE

CIB UNIGAS

BURNERS - BRUCIATORI - BRULERS - BRENNER - QUEMADORES - ГОРЕЛКИ

DANGERS, WARNINGS AND NOTES OF CAUTION

This manual is supplied as an integral and essential part of the product and must be delivered to the user.

Information included in this section are dedicated both to the user and to personnel following product installation and maintenance.

The user will find further information about operating and use restrictions, in the second section of this manual. we highly recommend to read it.

Carefully keep this manual for future reference.

The following:

- Entails the customer's acknowledgement and acceptance of the company's general terms and conditions of sale, in force at the date of order confirmation and available in the appendix to the current price lists.
- Is intended exclusively for specialised, experienced and trained users able to operate in conditions that are safe for people, the device and the environment, and in full compliance with the requirements set out on the following pages and with current health and safety regulations.

Information regarding assembly/installation, maintenance, replacement and repair is always and exclusively intended for (and therefore only to be carried out by) specialised personnel and/or directly by the Authorised Technical Service

IMPORTANT:

The supply has been made at the best conditions on the basis of the customer's order and technical indications concerning the state of the places and the installation systems, as well as the need to prepare certain certifications and / or additional adaptations with respect to the standard observed and transmitted for each product. In this respect, the manufacturer declines any responsibility for complaints, malfunctions, criticalities, damages and/or anything else consequent to incomplete, inaccurate and/ or missing information, as well as failure to comply with the technical requirements and installation regulations, initial start-up, operational management and maintenance.

For proper operation of the device, it is necessary to ensure the readability and conservation of the manual, also for future reference. In case of deterioration or more simply for reasons of technical and operational insight, contact the manufacturer directly. Text, descriptions, images, examples and anything else contained in this document are the exclusive property of the manufacturer. Any reproduction is prohibited.

RISK ANALYSIS

Instruction manual supplied with the burner:

This is an integral and essential part of the product and must not be separated from it. It must therefore be kept carefully for any necessary consultation and must accompany the burner even if it is transferred to another owner or user, or to another system. In the event of damage or loss, another copy must be requested from the local customer service centre;

Delivery of the system and instruction manual

- The supplier of the system is obliged to accurately inform the user about:-Use of the system;
- any further testing that may be necessary before activating the system;
- maintenance and the requirement to have the system checked at least once a year by a contractor or other specialised technician.

To ensure periodic monitoring, the manufacturer recommends drawing up a Maintenance Agreement.

WARRANTY AND LIABILITY

In particular, warranty and liability claims will no longer be valid in the event of damage to persons and/or property if such damage is due to any of the following causes:

- Incorrect installation, start-up, use and maintenance of the burner;
- Improper, incorrect or unreasonable use of the burner;
- Operation by unqualified personnel;
- Carrying out of unauthorised changes to the device;
- Use of the burner with safety devices that are faulty, incorrectly applied and/or not working;
- Installation of untested supplementary components on the burner;
- Powering of the burner with unsuitable fuels;

- Faults in the fuel supply system;
- Use of the burner even after an error and/or fault has occurred;
- Repairs and/or overhauls incorrectly carried out;
- Modification of the combustion chamber with inserts that prevent the regular development of the structurally established flame;
- Insufficient and inappropriate supervision and care of the burner components most subject to wear and tear;
- Use of non-original components, whether spare parts, kits, accessories and optionals;
- Force majeure.

Furthermore, the manufacturer declines all responsibility for non-compliance with this manual.

WARNING! Failure to comply with this manual, operational negligence, incorrect installation and unauthorised modifications will result in the manufacturer's warranty for the burner being voided.

Personnel training

The user is the person, organisation or company that has acquired the appliance and intends to use it for the specific purpose. The user is responsible for the appliance and for training the personnel that operate it.

The user:

- Undertakes to entrust the machine to suitably trained and qualified personnel;
- Must take all measures necessary to prevent unauthorised people gaining access to the appliance;
- Undertakes to adequately inform personnel about application and observance of the safety requirements, and therefore ensure that they are familiar with the operating instructions and safety requirements;
- Must inform the manufacturer if any faults or malfunctions of the accident prevention systems occur, and if there is any suspected danger;
- Personnel must always use the personal protective equipment required by law and follow the instructions provided in this manual;
- Personnel must observe all danger and caution notices on the appliance;
- Personnel must not carry out, on their own initiative, operations or interventions outside their area of expertise;
- Personnel must inform their superiors of any problem and danger that may arise;
- The assembly of parts of other makes, or any modifications made, may alter the characteristics of the appliance and may therefore compromise operational safety. The manufacturer therefore declines all responsibility for damages arising from the use of non-original parts.

GENERAL INTRODUCTION

- The equipment must be installed in compliance with the regulations in force, following the manufacturer's instructions, by qualified personnel.
- Qualified personnel means those having technical knowledge in the field of components for civil or industrial heating systems, sanitary hot water generation and particularly service centres authorised by the manufacturer.
- Improper installation may cause injury to people and animals, or damage to property, for which the manufacturer cannot be held liable.
- Remove all packaging material and inspect the equipment for integrity. In case of any doubt, do not use the unit contact the supplier.

The packaging materials (wooden crate, nails, fastening devices, plastic bags, foamed polystyrene, etc), should not be left within the reach of children, as they may prove harmful.

- Before any cleaning or servicing operation, disconnect the unit from the mains by turning the master switch OFF, and/or through the cutout devices that are provided.
- Make sure that inlet or exhaust grilles are unobstructed.
- In case of breakdown and/or defective unit operation, disconnect the unit. Make no attempt to repair the unit or take any direct action.

Contact qualified personnel only.

Units shall be repaired exclusively by a servicing centre, duly authorised by the manufacturer, with original spare parts and accessories.

Failure to comply with the above instructions is likely to impair the unit's safety.

To ensure equipment efficiency and proper operation, it is essential that maintenance operations are performed by qualified personnel at regular intervals, following the manufacturer's instructions.

When a decision is made to discontinue the use of the equipment,

those parts likely to constitute sources of danger shall be made harm-less.

- In case the equipment is to be sold or transferred to another user, or in case the original user should move and leave the unit behind, make sure that these instructions accompany the equipment at all times so that they can be consulted by the new owner and/or the installer.
- This unit shall be employed exclusively for the use for which it is meant. Any other use shall be considered as improper and, therefore, dangerous.

The manufacturer shall not be held liable, by agreement or otherwise, for WARNING! Failure to observe the information given in this manual, operating negligence, incorrect installation and carrying out of non authorised modifications will result in the annulment by the manufacturer of the guarantee that it supplies with the burner.

The damages resulting from improper installation, use and failure to comply with the instructions supplied by the manufacturer. The occurrence of any of the following circustances may cause explosions, polluting unburnt gases (example: carbon monoxide CO), burns, serious harm to people, animals and things:

- Failure to comply with one of the WARNINGS in this chapter
- Incorrect handling, installation, adjustment or maintenance of the burner
- Incorrect use of the burner or incorrect use of its parts or optional supply

SPECIAL INSTRUCTIONS FOR BURNERS

- a Make the following checks:
- the burner should be installed in a suitable room, with ventilation openings complying with the requirements of the regulations in force, and sufficient for good combustion;
- only burners designed according to the regulations in force should be used;
- this burner should be employed exclusively for the use for which it was designed;
- before connecting the burner, make sure that the unit rating is the same as delivery mains (electricity, gas oil, or other fuel);
- observe caution with hot burner components. These are, usually, near to the flame and the fuel pre-heating system, they become hot during the unit operation and will remain hot for some time after the burner has stopped.

When the decision is made to discontinue the use of the burner, the user shall have qualified personnel carry out the following operations:

- remove the power supply by disconnecting the power cord from the mains;
- b disconnect the fuel supply by means of the hand-operated shutoff valve and remove the control handwheels from their spindles.

Special warnings

- Make sure that the burner has, on installation, been firmly secured to the appliance, so that the flame is generated inside the appliance firebox.
- Before the burner is started and, thereafter, at least once a year, have qualified personnel perform the following operations:
 - a set the burner fuel flow rate depending on the heat input of the appliance;
 - b set the flow rate of the combustion-supporting air to obtain a combustion efficiency level at least equal to the lower level required by the regulations in force;
 - c check the unit operation for proper combustion, to avoid any harmful or polluting unburnt gases in excess of the limits permitted by the regulations in force;
 - d make sure that control and safety devices are operating properly;
 - e make sure that exhaust ducts intended to discharge the products of combustion are operating properly;
 - f on completion of setting and adjustment operations, make sure that all mechanical locking devices of controls have been duly tightened;
- g make sure that a copy of the burner use and maintenance instructions is available in the boiler room.
- In case of a burner shut-down, reser the control box by means of the RESET pushbutton. If a second shut-down takes place, call the Technical Service, without trying to RESET further.
- The unit shall be operated and serviced by qualified personnel only, in compliance with the regulations in force.

GENERAL INSTRUCTIONS DEPENDING ON FUEL USED ELECTRICAL CONNECTION

- For safety reasons the unit must be efficiently earthed and installed as required by current safety regulations.
- It is vital that all saftey requirements are met. In case of any doubt, ask for an accurate inspection of electrics by qualified personnel, since the manufacturer cannot be held liable for damages that may be caused by failure to correctly earth the equipment.
- Qualified personnel must inspect the system to make sure that it is adequate to take the maximum power used by the equipment shown on the equipment rating plate. In particular, make sure that the system cable cross section is adequate for the power absorbed by the unit.
- No adaptors, multiple outlet sockets and/or extension cables are permitted to connect the unit to the electric mains.
- An omnipolar switch shall be provided for connection to mains, as required by the current safety regulations.
- The use of any power-operated component implies observance of a few basic rules, for example:

- do not touch the unit with wet or damp parts of the body and/or with bare feet;

- do not pull electric cables;
- do not leave the equipment exposed to weather (rain, sun, etc.) unless expressly required to do so;
- do not allow children or inexperienced persons to use equipment;
- The unit input cable shall not be replaced by the user. In case of damage to the cable, switch off the unit and contact qualified personnel to replace.

When the unit is out of use for some time the electric switch supplying all the power-driven components in the system (i.e. pumps, burner, etc.) should be switched off.

FIRING WITH GAS, LIGHT OIL OR OTHER FUELS GENERAL General Warnings

- The burner shall be installed by qualified personnel and in compliance with regulations and provisions in force; wrong installation can cause injuries to people and animals, or damage to property, for which the manufacturer cannot be held liable.
- Before installation, it is recommended that all the fuel supply system pipes be carefully cleaned inside, to remove foreign matter that might impair the burner operation.
- Before the burner is commissioned, qualified personnel should inspect the following:
 - a the fuel supply system, for proper sealing;
 - b the fuel flow rate, to make sure that it has been set based on the firing rate required of the burner;
 - c the burner firing system, to make sure that it is supplied for the designed fuel type;
 - d the fuel supply pressure, to make sure that it is included in the range shown on the rating plate;
 - e the fuel supply system, to make sure that the system dimensions are adequate to the burner firing rate, and that the system is equipped with all the safety and control devices required by the regulations in force.
- When the burner is to remain idle for some time, the fuel supply tap or taps should be closed.

Special instructions for using gas

- Have qualified personnel inspect the installation to ensure that:
 - a the gas delivery line and train are in compliance with the regulations and provisions in force;
 - b all gas connections are tight;
 - c the boiler room ventilation openings are such that they ensure the air supply flow required by the current regulations, and in any case are sufficient for proper combustion.
- Do not use gas pipes to earth electrical equipment.
- Never leave the burner connected when not in use. Always shut the gas valve off.
- In case of prolonged absence of the user, the main gas delivery valve to the burner should be shut off.

BURER DATA PLATE

For the following information, please refer to the data plate:

- Burner type and burner model: must be reported in any communication with the supplier
- Burner ID (serial number): must be reported in any communication with the supplier
- Date of production (year and month)
- Information about fuel type and network pressure

Precautions if you can smell gas

- a do not operate electric switches, the telephone, or any other item likely to generate sparks;
- b immediately open doors and windows to create an air flow to purge the room;
- c close the gas valves;
- d contact qualified personnel.
- Do not obstruct the ventilation openings of the room where gas appliances are installed, to avoid dangerous conditions such as the development of toxic or explosive mixtures.

Using oil pressure gauges

Generally, pressure gauges are equipped with a manual valve. Open the valve only to take the reading and close it immediately afterwards.

SYMBOLS USED

Failure to observe the warning may result in electric shock with lethal consequences.

BURNER SAFETY

The burners- and the configurations described below - comply with the regulations in force regarding health, safety and the environment. For more in-depth information, refer to the declarations of conformity that are an integral part of this Manual.

DANGER! Incorrect motor rotation can seriously damage property and injure people.

.Do not touch any mechanical moving parts with your hands or any other part of your body. Injury hazard

Do not touch any parts containing fuel (i.e. tank and pipes). Scalding hazard

Do not use the burner in situations other than the ones provided for in the data plate.

Do not use fuels other than the ones stated.

Do not use the burner in potentially explosive environments.

Do not remove or by-pass any machine safety devices

Do not remove any protection devices or open the burner or any other component while the burner is running.

Do not disconnect any part of the burner or its components while the burner is running.

Untrained staff must not modify any linkages.

After any maintenance, it is important to restore the protection devices before restarting the machine.All safety devices must be kept in perfect working order.

Personnel authorized to maintain the machine must always be provided with suitable protections.

ATTENTION: while running, the parts of the burner near the generator (coupling flange) are subject to overheating. Where necessary, avoid any contact risks by wearing suitable PPE.

Safety and prevention

- Opening or tampering with the burner components is not allowed, apart from the parts requiring maintenance.
- Only those parts envisaged by the manufacturer can be replaced.

DIRECTIVES AND STANDARDS

PART I: SPECIFICATIONS

BURNERS FEATURES

This series represents monobloc gas burners made in die-cast aluminium housing, that can burn either gas or light oil, thanks to the adjustable combustion head which allows a good performance with both fuels. They can be provided in progressive or fully-modulating version.

- 1 Control panel with startup switch
- 2 Gas valve group
- 3 Burner flange
- 4 Blast tube-Combustion head ass.y
- 5 Cover
- 6 Oil pressure switch
- 7 Light oil pump
- 8 Pump motor
- 9 Gas adjusting cam (progressive/fully modulating burners only)
- 10 Actuator

11 Air pressure switch

Note: the figure is indicative only

Gas operation: the gas coming from the supply line, passes through the valves group provided with filter and governor. This one forces the pressure in the utilisation limits. The actuators move proportionally the air damper and the gas butterfly valve, in order to achieve the optimisation of the gas flue values, as to get an efficient combustion.

Light oil operation: the fuel coming from the supply line, is pushed by the pump to the nozzle and then into the combustion chamber, where the mixture between fuel and air takes place and consequently the flame.

In the burners, the mixture bertween fuel and air, to perform clean and efficient combustion, is activated by atomisation of oil into very small particles. This process is achieved making pressurised oil passing through the nozzle.

The pump main function is to transfer oil from the tank to the nozzle in the desired quantity and pressure. To adjust this pressure, pumps are provided with a pressure regulator (except for some models for which a separate regulating valve is provided). Other pumps are provided with two pressure regulators: one for the high and one for low pressure (in double-stage systems with one nozzle).

The adjustable combustion head can improve the burner performance. The combustion head determines the energetic quality and the geometry of the flame. Fuel and comburent are routed into separated ways as far as the zone of flame generation (combustion chamber). The control panel, placed on the burner front side, shows each operating stage.

Fuel

WARNING! The burner must be used only with the fuel specified in the burner data plate .

The burner technical specifications, described in this manual, refer to natural gas (calorific net value Hi = 9.45 kWh/Stm³, density ρ = 0.717 Kg/Stm³) and LPG (calorific net value Hi = 26.79 kWh/Stm³, density ρ = 2.151 Kg/Stm³). For different fuel such as town gas and biogas, multiply the values of flow and pressure by th corrective factors shown in the table below.

| Fuel | Hi (KWh/Stm ³) | ρ (kg/Stm ³) | f _Q | f _p |
|----------|----------------------------|---------------------------------|----------------|----------------|
| Town gas | 4,88 | 0,6023 | 1,936 | 3,3 |
| Biogas | 6,395 | 1,1472 | 1,478 | 3,5 |

For example, to obtain the flow and pressure values for the biogas:

 $Q_{biogas} = Q_{naturalGas} \cdot 1,478$ $p_{biogas} = p_{naturalGas} \cdot 3,5$

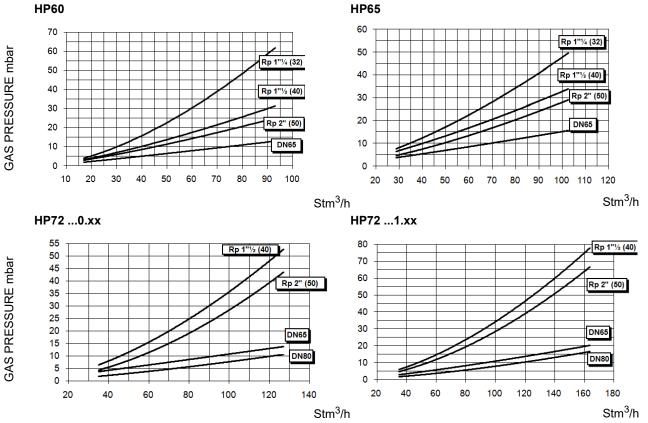

ATTENTION! The combustion head type and the settings depend on the fuel. The burner must be used only for its intended purpose specified in the burner data plate .

A

ATTENTION! The corrective factors in the above table depend on the gas composition, so on the calorifc value and the density of the gas. The above value can be taken only as reference.

Pressure in the Network / gas flow rate curves (natural gas)

ATTENTION: the gas rate value is quoted on the x-axis, the related network pressure is quoted on the y-axis (pressure value in the combustion chamber is not included). To know the minimum pressure at the gas train inlet, necessary to get the requested gas rate, add the pressure value in the combustion chamber to the value read on the y-axis.

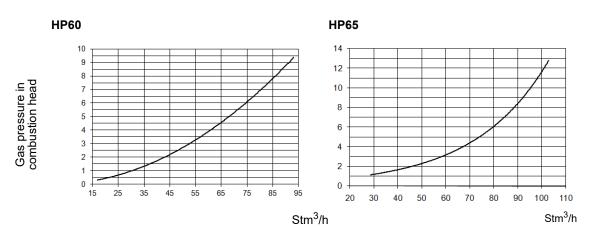

To get the input in kcal/h, multiply value in kW by 860.

Data are referred to standard conditions: atmospheric pressure at 1013mbar, ambient temperature at 15° C

NOTE: The performance curve is a diagram that represents the burner performance in the type approval phase or in the laboratory tests, but does not represent the regulation range of the machine. On this diagram the maximum output point is usually reached by adjusting the combustion head to its "MAX" position (see paragraph "Adjusting the combustion head"); the minimum output point is reached setting the combustion head to its "MIN" position. During the first ignition, the combustion head is set in order to find a compromise between the burner output and the generator specifications, that is why the minimum output may be different from the Performance curve minimum

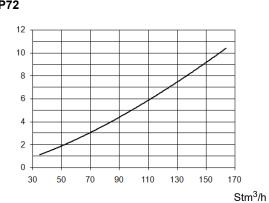

Gas pressure burner head vs natural gas flow rate

Curves are referred to pressure = 0 mbar in the combustion chamber!

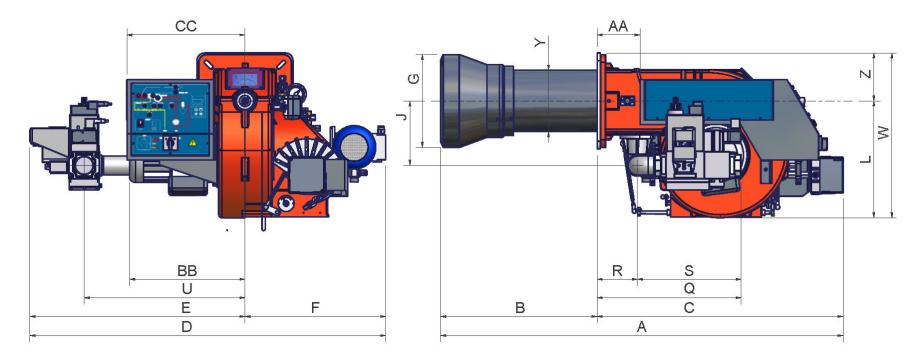

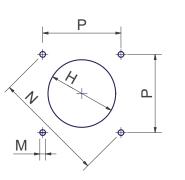

Gas pressure in combustion head

*DN = gas valves size

HP60 - HP72:

it is recommended to fit a counterflange between burner and boiler, a gasket must be placed between the generator and the counterflange. As an alternative, make a smaller hole H, but greather than Y and fit the blast tube from the internal side of boiler.

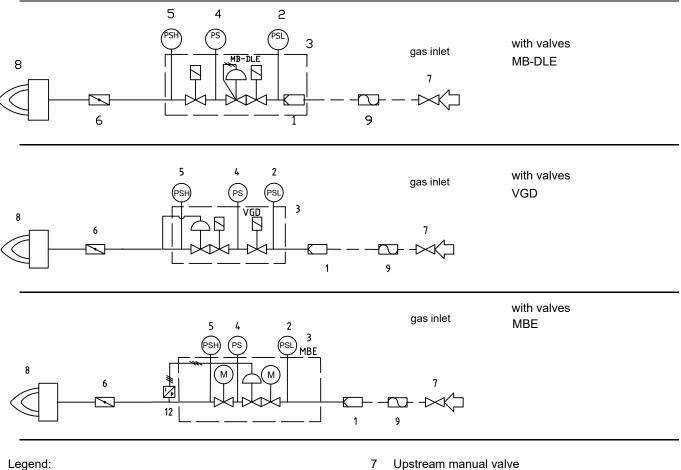

Note: The following POS are optional: 19, 20, 40, 41, 46

GAS TRAIN CONNECTION

ATTENTION: Before executing the connections to the gas pipe network, be sure that the manual cutoff valves are closed.

The following diagrams show some examples of possible gas trains with the components supplied with the burner and those fitted by the installer. The gas trains and the connection of the burner to the fuel supply line must be done in accordance with current local regulations.

Filter 1

- Low pressure switch PGMIN 2
- 3 Safety valve
- 4 Proving system pressure switch - PGCP (*optional)
- High pressure switch PGMAX: mandatory for MBE, optional 5 for VGD and DMV-DLE
- Butterfly valve 6

- 7 Upstream manual valve
- Main burner 8
- 9 Antivibration joint (*optional)
- 12 MBE pressure sensor

How to read the burner "Performance curve"

To check if the burner is suitable for the boiler to which it must be installled, the following parameters are needed:

- furnace input, in kW or kcal/h (kW = kcal/h/860);
- backpressure (data are available on the boiler ID plate or in the user's manual).

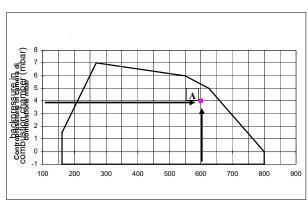

Example:

Furnace input: 600kW

Backpressure: 4 mbar

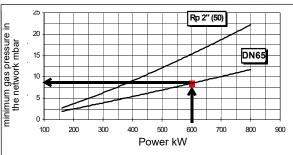

In the "Performance curve" diagram, draw a vertical line matching the furnace input value and an horizontal line matching the backpressure value. The burner is suitable if the intersection point A is inside the performance curve.

Data are referred to standard conditions: atmospheric pressure at 1013 mbar, ambient temperature at 15° C.

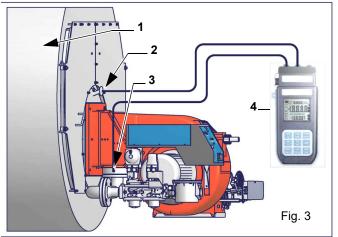

Checking the proper gas train size

To check the proper gas train size, it is necessary to the available gas pressure value upstream the burner's gas valve. Then subtract the backpressure. The result is called **pgas**. Draw a vertical line matching the furnace input value (600kW, in the example), quoted on the x-axis, as far as intercepitng the network pressure curve, according to the installed gas train (DN65, in the example). From the interception point, draw an horizontal line as far as matching, on the y-axis, the value of pressure necessary to get the requested furnace input. This value must be lower or equal to the **pgas** value, calculated before.

Combustion head gas pressure curves

Combustion head gas pressure depends on gas flow and combustion chamber backpressure. When backpressure is subtracted, it depends only on gas flow, provided combustion is properly adjusted, flue gases residual O2 percentage complies with "Recommended combustion values" table and CO in the standard limits). During this stage, the combustion head, the gas butterfly valve and the actuator are at the maximum opening. Refer to , showing the correct way to measure the gas pressure, considering the values of pressure in combustion chamber, surveyed by means of the pressure gauge or taken from the boiler's Technical specifications..

Note: the figure is indicative only.Key

- 1 Generator
- 2 Pressure outlet on the combustion chamber
- 3 Gas pressure outlet on the butterfly valve
- 4 Differential pressure gauge

ATTENTION: the burned gas rate must be read at the gas flow meter. when it is not possible, the user can refers to the pressure-rate curves as general information only.

Measuring gas pressure in the combustion head

In order to measure the pressure in the combustion head, insert the pressure gauge probes: one into the combustion chamber's pressure outlet to get the pressure in the combustion chamber and the other one into the butterfly valve's pressure outlet of the burner. On the basis of the measured differential pressure, it is possible to get the maximum flow rate: in the pressure - rate curves (showed on the next paragraph), it is easy to find out the burner's output in Stm³/h (quoted on the x axis) from the pressure measured in the combustion head (quoted on the y axis). The data obtained must be considered when adjusting the gas flow rate.

MOUNTING AND CONNECTING THE BURNER

Transport and storage

If the product must be stored, avoid humid and corrosive places. Observe the temperatures stated in the burner data table at the beginning of this manual. The packages containing the burners must be locked inside the means of transport in such a way as to guarantee the absence of dangerous movements and avoid any possible damage.

In case of storage, the burners must be stored inside their packaging, in storerooms protected from the weather. Avoid humid or corrosive places and respect the temperatures indicated in the burner data table at the beginning of this manual.

Packing

The burners are despatched in wooden crates whose dimensions are:

• 1370mm x 930mm x 820mm

Such packages fear moisture and are not suitable for stacking.Packing cases of this type are affected by humidity and are not suitable for stacking.

The following are placed in each packing case: These packagings are damaged by moisture **H** and the maximum number of overlapping packagings indicated on the outside of the packaging may not be exceeded.

- burner with detached gas train;
- gasket or ceramic fibre plait (according to burner type) to be inserted between the burner and the boiler;
- envelope containing this manual and other documents.
- oil flexible hoses;

To get rid of the burner's packing, follow the procedures laid down by current laws on disposal of materials.

Handling the burner

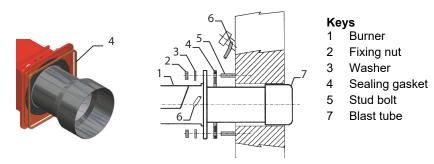

WARNING! The handling operations must be carried out by specialised and trained personnel. If these operations are not carried out correctly, the residual risk for the burner to overturn and fall down still persists. To move the burner, use means suitable to support its weight (see paragraph "Technical specifications").

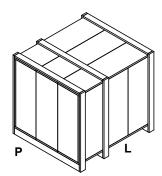

Fitting the burner to the boiler

To install the burner into the boiler, proceed as follows:

- 1 make a hole on the closing door of the combustion chamber as described on paragraph "Overall dimensions")
- 2 place the burner to the boiler: lift it up and handle it according to the procedure described on paragraph "Handling the burner";
- 3 place the 4 stud bolts (5) on boiler's door, according to the burner drilling template described on paragraph "Overall dimensions";
- 4 fasten the 4 stud bolts;
- 5 place the gasket on the burner flange;
- 6 install the burner into the boiler;
- 7 fix the burner to the stud bolts, by means of the fixing nuts, according to the next picture.
- 8 After fitting the burner to the boiler, ensure that the gap between the blast tube and the refractory lining is sealed with appropriate insulating material (ceramic fibre cord or refractory cement).

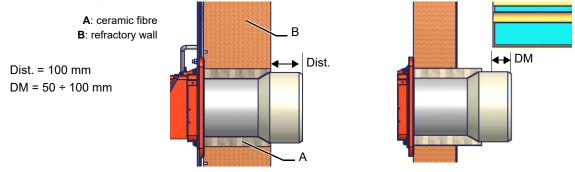

The burner is designed to work positioned according to the picture below. For different installations, please contact the Manufacture.

Matching the burner to the boiler

The burners described in this manual have been tested with combustion chambers that comply with EN676 regulation and whose dimensions are described in the diagram. In case the burner must be coupled with boilers with a combustion chamber smaller in diameter or shorter than those described in the diagram, please contact the supplier, to verify that a correct matching is possible, with respect of the application involved. To correctly match the burner to the boiler verify the type of the blast tube . Verify the necessary input and the pressure in combustion chamber are included in the burner performance curve; otherwise the choice of the burner must be revised consulting the burner manufacturer. To choose the blast tube lenght follow the instructions of the boiler manufacturer. In absence of these consider the following:

- Cast-iron boilers, three pass flue boilers (with the first pass in the rear part): the blast tube must protrude no more than **Dist** = 100 mm into the combustion chamber. (please see the picture below)
- Pressurised boilers with flame reversal: in this case the blast tube must penetrate **Dm** 50 ÷ 100 mm into combustion chamber in respect to the tube bundle plate.(please see the picture below)

WARNING! Carefully seal the free space between blast tube and the refractory lining with ceramic fibre rope or other suitable means.

The length of the blast tubes does not always allow this requirement to be met, and thus it may be necessary to use a suitably-sized spacer to move the burner backwards or to design a blast tube tha suites the utilisation (please, contact the manifacturer).

GAS TRAIN CONNECTIONS

WARNING: before executing the connections to the gas pipe network, be sure that the manual cutoff valves are closed.

ATTENTION: it is recommended to mount filter and gas valves to avoid that extraneous material drops inside the valves, during maintenance and cleaning operation of the filters (both the filters outside the valves group and the ones built-in the gas valves).

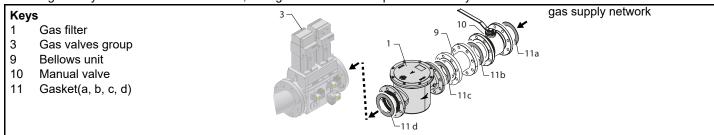

ATTENTION: once the gas train is mounted, the gas proving test must be performed, according to the procedure set by laws in force.

CAUTION: The direction of gas flow must follow the arrow on the body of the components mounted on the gas ramp (valves, filters, gaskets...).

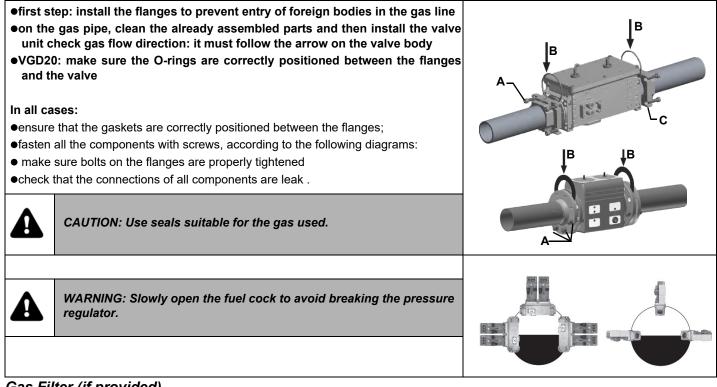

NOTE: the bellows unit, the manual cutoff valve and the gaskets are not part of the standard supply

Following the "Hydraulic Schematics" section, the figure shows the components fitted by the installer.

Procedure to install the double gas valve unit: two (2) gas flanges are required; they may be threaded or flanged depending on size

Gas Filter (if provided)

The gas filters remove the dust particles that are present in the gas, and prevent the elements at risk (e.g.: burner valves, counters and regulators) from becoming rapidly blocked. The filter is normally installed upstream from all the control and on-off devices.

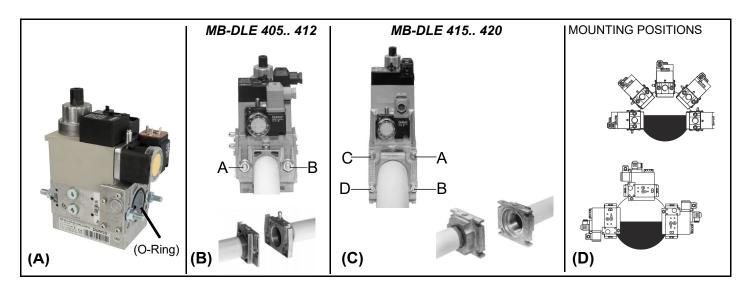

ATTENTION: it is reccomended to install the filter with gas flow parallel to the floor in order to prevent dust fall on the safety valve during maintenance operation.

Once the train is installed, connect the gas valves group and pressure switches plugs.

MultiBloc MB-DLE - Assembling the gas train

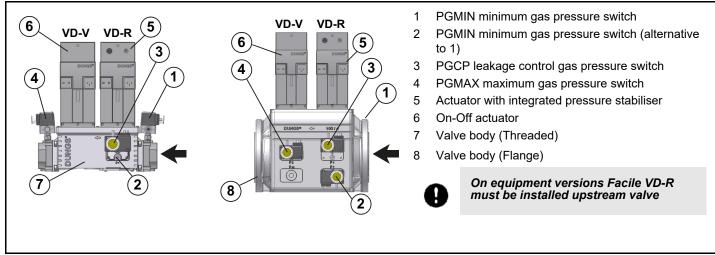

Mounting

- 1 Mount flange onto tube lines: use appropriate sealing agent
- 2 Insert MB-DLE: note position of O rings
- 3 Remove MultiBloc between the threaded flanges
- 4 After installation, perform leakage and functional test
- 5 Disassembly in reverse order

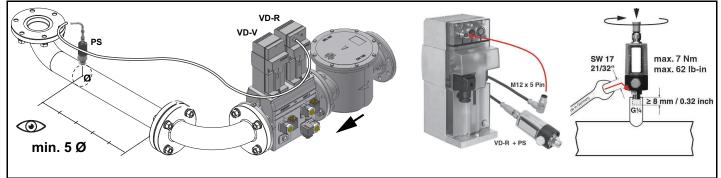

DUNGS MBE

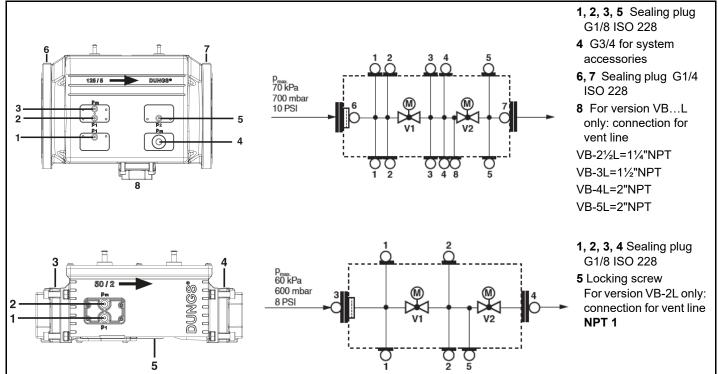

Components and position of pressure switches

PS pressure sensor connection to VD-R actuator and gas train

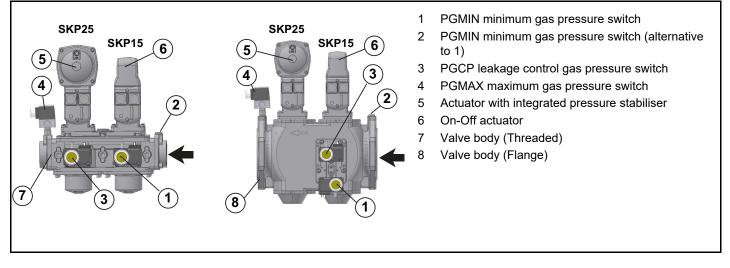

Attention: In the case of the MBE ... valve, a pressure limit switch downstream of the safety valve is mandatory.

OIL TRAIN CONNECTIONS OIL TRAIN CONNECTIONS Hydraulic diagrams for light oil supplying circuits

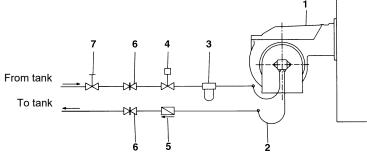

Installation diagram of light oil pipes

please read carefully the "warnings" chapter at the beginning of this manual.

The burner is supplied with filter and flexible hoses, all the parts upstream the filter and downstream the return flexible hose, must be installed by the customer. As far as the hoses connection, see the related paragraph.

(*) Only for installations with gravity, siphon or forced circulation feed systems. If the device installed is a solenoid valve, a timer must be installed to delay the valve closing. The direct connection of the device without a timer may cause pump breaks.

Key

- 1 Burner
- 2 Flexible hoses (fitted)
- 3 Light oil filter (fitted)
- 4 Automatic interceptor (*)
- 5 One-way valve (*)
- 6 Gate valve
- 7 Quick-closing gate-valve (outside the tank or boiler rooms)

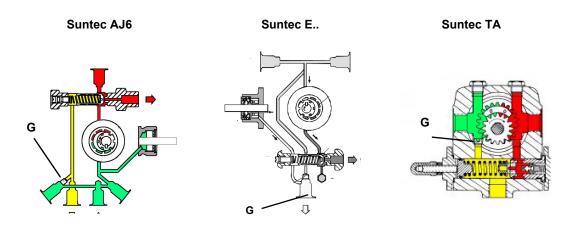

Depending on the installed pump, it is possible to design the plant for single or double pipe feeding line

Single-pipe system: a single pipe drives the oil from the tank to the pump's inlet. Then, from the pump, the pressurised oil is driven to the nozzle: a part comes out from the nozzle while the othe part goes back to the pump. In this system, the by-pass plug, if provided, must be removed and the optional return port, on the pump's body, must be sealed by steel plug and washer.

Double-pipe system: as for the single pipe system, a pipe that connects the tank to the pump's inlet is used besides another pipe that connects the pump's return port to the tank, as well. The excess of oil goes back to the tank: this installation can be considered self-bleeding. If provided, the inside by-pass plug must be installed to avoid air and fuel passing through the pump.

Burners come out from the factory provided for double-pipe systems. They can be suited for single-pipe system (recommended in the case of gravity feed) as decribed before. To change from a 1-pipe system to a 2-pipe-system, insert the by-pass plug **G** (as for ccw-rota-tion- referring to the pump shaft).

Caution: Changing the direction of rotation, all connections on top and side are reversed.**HP UHE series pumps**: a kit (Art.-Nr.: 0841211) is required for the transition from 2-pipe to 1-pipe system

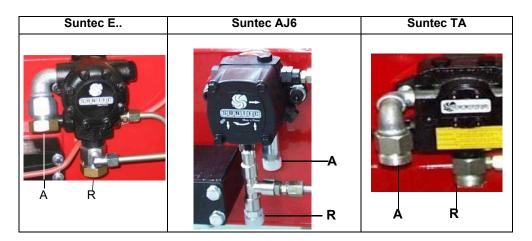

Connecting the oil flexible hoses to the pump

To connect the flexible oil hoses to the pump, proceed as follows, according to the pump provided:

- 1 remove the closing nuts A and R on the inlet and return connections of the pump;
- 2 screw the rotating nut of the two flexible hoses on the pump **being careful to avoid exchanging the lines**: see the arrows marked on the pump.

For further information, refer to the technical documentation of the pump.

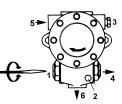

About the use of fuel pumps

- Do not use fuel with additives to avoid the possible formation over time of compounds which may deposit between the gear teeth, thus obstructing them.
- After filling the tank, wait before starting the burner. This will give any suspended impurities time to deposit on the bottom of the tank, thus avoiding the possibility that they might be sucked into the pump.
- On initial commissioning a "dry" operation is foreseen for a considerable length of time (for example, when there is a long suction line to bleed). To avoid damages inject some lubrication oil into the vacuum inlet.
- Care must be taken when installing the pump not to force the pump shaft along its axis or laterally to avoid excessive wear on the joint, noise and overloading the gears.
- Pipes should not contain air pockets. Rapid attachment joint should therefore be avoided and threaded or mechanical seal junctions preferred. Junction threads, elbow joints and couplings should be sealed with removable sg component. The number of junctions should be kept to a minimum as they are a possible source of leakage.
- Do not use PTFE tape on the suction and return line pipes to avoid the possibility that particles enter circulation. These could deposit on the pump filter or the nozzle, reducing efficiency. Always use O-Rings or mechanical seal (copper or aluminium gaskets) junctions if possible.
- An external filter should always be installed in the suction line upstream the fuel unit.

A

ATTENTION: before the burner first start, it is mandatory to fill the adduction pipes with diesel fuel and bleed out residual air bubbles. Prior to switching on the burner, check direction of rotation of the pump motor by briefly pressing the starter switch; ensure there are no anomalous sounds during equipment operation, and only then turn on the burner. Neglect to comply with this requirement will invalidate the burner warranty.

ELECTRICAL CONNECTIONS

WARNING! Respect the basic safety rules. make sure of the connection to the earthing system. do not reverse the phase and neutral connections. fit a differential thermal magnet switch adequate for connection to the mains. WARNING! before executing the electrical connections, pay attention to turn the plant's switch to OFF and be sure that the burner's main switch is in 0 position (OFF) too. Read carefully the chapter "WARNINGS", and the "Electrical connections" section.

ATTENTION: Connecting electrical supply wires to the burner teminal block MA, be sure that the ground wire is longer than phase and neutral ones.

- 1 To execute the electrical connections, proceed as follows:remove the cover from the electrical board, unscrewing the fixing screws;
- 2 execute the electrical connections to the supply terminal board as shown in the attached wiring diagrams;
- 3 check the direction of the fan motor (see next paragraph);
- 4 refit the panel cover.

WARNING: (only for double stage and progressive burners) The burner is provided with an electrical bridge between terminals 6 and 7; when connecting the high/low flame thermostat, remove this bridge before connecting the thermostat.

CAUTION: check the motor thermal cut-out adjustment

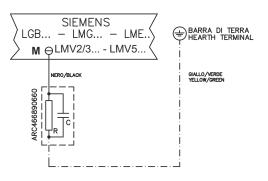

NOTE: the burners are supplied for three-phase 380/400/415/480 V supply, and in the case of three-phase 220/230/240 V supply it is necessary to modify the electrical connections into the terminal box of the electric motor and replace the overload tripped relay.

Note on electrical supply

In the case where the power supply of the AUXILIARIES of the phase-phase burner (without a neutral), for the flame detection it is necessary to connect the RC circuit Siemens between the terminal 2 (terminal X3-04-4 in case of LMV2x, LMV3x, LMV5x, LME7x) of the base and the earth terminal, RC466890660. For LMV5 control box, please refer to the clabeling recommendations available on the Siemens CD attached to the burner

Key

C - Capacitor (22 nF , 250 V) LME / LMV - Siemens control box R - Resistor (1 M Ω) M: Terminal 2 (LGB, LME), Terminal X3-04-4 (LMV2x, LMV3x, LMV5, LME7x) RC466890660 - RC Siemens filter

DANGER! Incorrect motor rotation can seriously damage property and injure people.

DANGER: During commissioning operations, do not let the burner operate with insufficient air flow (danger of formation of carbon monoxide); if this should happen, make the gas decrease slowly until the normal combustion values are achieved. **WARNING:** before starting the burner up, be sure that the manual cutoff valves are open and check that the pressure upstream the gas train complies the value quoted on paragraph "Technical specifications". Be sure that the mains switch is closed.

IN THE EVENT OF A BLOCKAGE, THE CAUSE MUST BE ASSESSED. IF THE FLAME BACKFIRE WARNING LIGHT IS ON, IT IS IMPERATIVE TO CHECK THE INTEGRITY AND GOOD CONDITION OF THE COMBUSTION HEAD AS DESCRIBED IN THE MAINTENANCE SECTION BEFORE UNLOCKING THE APPLIANCE.

LIMITATIONS OF USE

THE BURNER IS AN APPLIANCE DESIGNED AND CONSTRUCTED TO OPERATE ONLY AFTER BEING CORRECTLY CONNEC-TED TO A HEAT GENERATOR (E.G. BOILER, HOT AIR GENERATOR, FURNACE, ETC.), ANY OTHER USE IS TO BE CONSIDE-RED IMPROPER AND THEREFORE DANGEROUS.

THE USER MUST GUARANTEE THE CORRECT FITTING OF THE APPLIANCE, ENTRUSTING THE INSTALLATION OF IT TO QUALIFIED PERSONNEL AND HAVING THE FIRST COMMISSIONING OF IT CARRIED OUT BY A SERVICE CENTRE AUTHORI-SED BY THE COMPANY MANUFACTURING THE BURNER.

A FUNDAMENTAL FACTOR IN THIS RESPECT IS THE ELECTRICAL CONNECTION TO THE GENERATOR'S CONTROL AND SAFETY UNITS (CONTROL THERMOSTAT, SAFETY, ETC.) WHICH GUARANTEES CORRECT AND SAFE FUNCTIONING OF THE BURNER.

THEREFORE, ANY OPERATION OF THE APPLIANCE MUST BE PREVENTED WHICH DEPARTS FROM THE INSTALLATION OPERATIONS OR WHICH HAPPENS AFTER TOTAL OR PARTIAL TAMPERING WITH THESE (E.G. DISCONNECTION, EVEN PARTIAL, OF THE ELECTRICAL LEADS, OPENING THE GENERATOR DOOR, DISMANTLING OF PART OF THE BURNER).

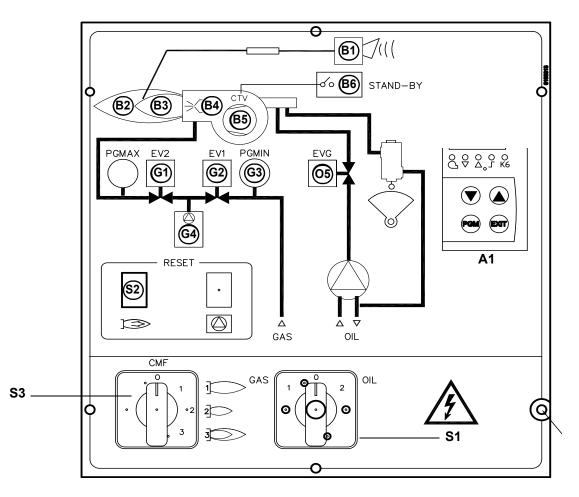

NEVER OPEN OR DISMANTLE ANY COMPONENT OF THE MACHINE EXCEPT FOR ITS MAINTENANCE. TO SECURE THE MACHINE, ACT ON THE ISOLATOR SWITCH. IN CASE OF ANOMALIES THAT REQUIRED A SHUT DOWN OF THE BURNER, IT'S POSSIBLE TO ACT ON THE AUXILIARY LINE SWITCH, LOCATED ON THE BURNER FRONT PANEL.

IN CASE OF A BURNER SHUT-DOWN, RESET THE CONTROL BOX BY MEANS OF THE RESET PUSHBUTTON. IF A SECOND SHUT-DOWN TAKES PLACE, CALL THE TECHNICAL SERVICE, WITHOUT TRYING TO RESET FURTHER.

WARNING: DURING NORMAL OPERATION THE PARTS OF THE BURNER NEAREST TO THE GENERATOR (COUPLING FLANGE) CAN BECOME VERY HOT, AVOID TOUCHING THEM SO AS NOT TO GET BURNT.

Fully modulating / Progressive Burners

Fig. 3 - Burner control panel

Keys

- S1 Main switch (0=Off, 1=GAS, 2=OIL)
- S2 Reset pushbutton for control box
- S3 CMF switch (0=stop, 1=low flame, 2=high flame, 3=automatic) fully modulating burners only
- D Gas proving system reset pushbutton (only for burners with Siemens LDU11 provided)
- B1 Lock-out LED
- B2 Hi-flame operation LED
- B3 Lo-flame operation LED
- B4 "Ignition transformer operation" LED
- B5 "Fan motor overload tripped" LED
- B6 Stand-by signalling lamp
- G1 Gas valves EV2 operation signalling lamp
- G2 Gas valves EV1 operation signalling lamp
- G3 Gas pressure switch signal lamp
- G4 Gas proving system lockout signalling lamp
- O5 Oil valve EVG operation signalling lamp
- A1 Burner Modulator (only on fully modulating burners)

Fuel selection:

In order to start the burner with gas or light oil, the operator must commute the selector on the burner control panel on (1) = gas, or (2) = light oil.

If the selector is set on (1) the gas cock must be open, while the light oil cock must be closed. Viceversa if the selector is set on (2). **CAUTION:** if the fuel chosen is oil, be sure the cutoff valves on the feed and return pipes are open.

Gas operation

- Check the gas feeding pressure is sufficient (signalling lamp G3 on).
- Burners fitted with gas proving system: the gas proving system test begins; when the test is performed the proving system LED turns on. At the end of the test, the burner staring cycle begins: in case of leakage in a valve, the gas proving system stops the burner and the lamp **B1** turns on.

NOTE: if the burner is fitted with Dungs VPS504, the pre-purgue phase starts once the gas proving system is successfully performed. Since the pre-purgue phase must be carried out with the maximum air rate, the control box drives the actuator opening and when the maximum opening position is achieved, the pre-purge time counting starts.

- At the end of the pre-purge time, the actuator drives the complete closing (ignition with gas position) and, as this is achieved the ignition transformer is energised (LED **B4** is on); the gas valves open.
- Few seconds after the valves opening, the transformer is de-energised and lamp B4 turns off.
- The burner is now operating, meanwhile the actuator goes to the high flame position and, after some seconds, the two-stage operation begins; the burner is driven automatically to high flame or low flame, according to the plant requirements.
- Operation in high or low flame is signalled by lamp B2 on the frontal panel.

Light oil operation

- The fan motor starts and the pre-purge phase as well. Since the pre-purge phase must be carried out at the maximum air rate, the control box drives the actuator opening and when the maximum opening position is reached, the pre-purge time counting starts.
- At the end of the pre-purge time, the actuator is in the light oil ignition position: the ignition transformer is energised (lamp B4 on); the ignitor gas valves (if provided) and the light oil valves open. Few seconds after the valves opening, the transformer is de-energised and lamp B4 turns off.
- The burner is now operating, meanwhile the actuator goes to the high flame position; after some seconds, the two-stage operation begins; the burner is driven automatically to high flame or low flame, according to the plant requirements. Operation in high or low flame is signalled by LED B2 on the burner control panel.

AIR FLOW AND FUEL ADJUSTMENT

WARNING! During commissioning operations, do not let the burner operate with insufficient air flow (danger of formation of carbon monoxide); if this should happen, make the fuel decrease slowly until the normal combustion values are achieved.

WARNING! the combustion air excess must be adjusted according to the values in the following chart.

| Recommended combustion parameters | | | |
|-----------------------------------|---------------------------------|--------------------------------|--|
| Fuel | Recommended (%) CO ₂ | Recommended (%) O ₂ | |
| Natural gas | 9 ÷ 10 | 3 ÷ 4.8 | |
| Light oil | 11.5 ÷ 13 | 2.9 ÷ 4.9 | |
| LPG | 11 ÷ 12 | 2.8 ÷ 4.3 | |

Adjustments - brief description

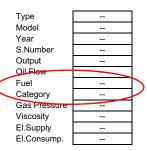

Adjust the air and gas flow rates at the maximum output ("high flame") first, by means of the air damper and the adjusting cam respectively.

- Check that the combustion parameters are in the suggested limits.
- .Check the flow rate measuring it on the counter or, if it was not possible, verifying the combustion head pressure by means of a differential pressure gauge.
- Then, adjust the combustion values corresponding to the points between maximum and minimum: set the shape of the adjusting cam foil. The adjusting cam sets the air/gas ratio in those points, regulating the opening-closing of the throttle gas valve.
- Set, now, the low flame output, acting on the low flame microswitch of the actuator in order to avoid the low flame output increasing too much or that the flues temperature gets too low to cause condensation in the chimney.

Type of fuel used

DANGER! The burner must be used only with the fuel specified in the burner data plate.

ADJUSTMENTS FOR GAS OPERATION

Adjustments - brief description

- Adjust the air and gas flow rates at the maximum output ("high flame") first, by means of the air damper and the valves group pressure stabiliser respectively.
- Check that the combustion parameters are in the suggested limits.
- Check the flow rate measuring it on the counter or, if it was not possible, verifying the combustion head pressure by means of a differential pressure gauge, as described on par. "Measuring the gas pressure in the combustion head".
- Then, adjust the combustion values corresponding to the points between maximum and minimum (progressive -fully modulating burners only): set the shape of the adjusting cam foil. The adjusting cam sets the air/gas ratio in those points, regulating the opening-closing of the air damper.
- Set, now, the low flame output, acting on the low flame microswitch of the actuator in order to avoid the low flame output increasing too much or that the flues temperature gets too low to cause condensation in the chimney.

To change the burner setting during the testing in the plant, follows the next procedure, according to the model provided.

Progressive burners

Air and Gas Flow Rate Settings by means of Berger STM30../Siemens SQM40.. actuator

- 1 check the fan motor rotation.
- 2 Only for burners provided with Multibloc MB-DLE gas valves: before starting the burner up, set the slow opening. To set the slow opening, remove cover T, reverse it upside down and use it as a tool to rotate screw VR. Clockwise rotation reduces start flow rate, anticlockwise rotation increases it. Do not use a screwdriver on the screw VR!

Note: the screw VSB must be removed only in case of replacemente of the coil.

- 3 Before starting the burner up, drive the high flame actuator microswitch matching the low flame one (in order to let the burner operates at the lowest output) to safely achieve the high flame stage.
- 4 Start the burner up by means of the thermostat series and wait until the pre-purge time comes to an end and that the burner starts up;
- 5 drive the burner to high flame stage, by means fo the thermostat **TAB**.
- 6 Then move progressively the microswitch to higher values until it reaches the high flame position; always check the combustion values and eventually adjusting the gas by means of the valves group stabiliser.
- 7 go on adjusting air and gas flow rates: check, continuosly, the flue gas analisys, as to avoid combustion with little air; dose the air according to the gas flow rate change following the steps quoted below;

SQM40.265 Actuator cams

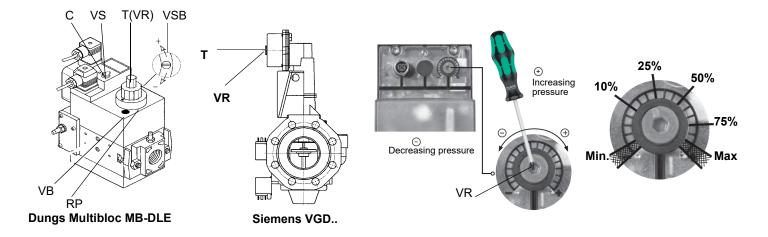

(RD) I High flame
(BU) IIStand-by
(OG) IIILow flame - gas
(YE) IV Low flame - oil
(BK) V Ignition - oil
(GN) VI Ignition - gas

8acting on the pressure stabiliser of the valves group, adjust the **gas flow rate in the high flame stage** as to meet the values requested by the boiler/utilisation:

-Multibloc MB-DLE: The pressure governor is adjusted by operating the screw VS located under the cover C. By screwing down the pressure is increased and by unscrewing it is reduced. The valve is adjusted by means of the RP regulator after slackening the locking screw VB by a number of turns. By unscrewing the regulator RP the valve opens, screwing the valve closes.

- Siemens VGD valves group: remove cap T and act on the VR adjusting screw to increase or decrease the pressure and consequently the gas rate; screwind VR the rate increases, unscrewing it decreases (see next figure).

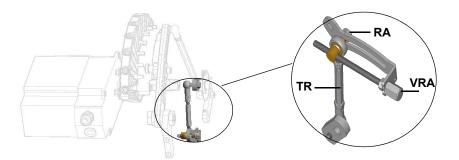

- MultiBloc MBETo set the outlet pressure of the VD-R regulator, act on the adjustment ring nut

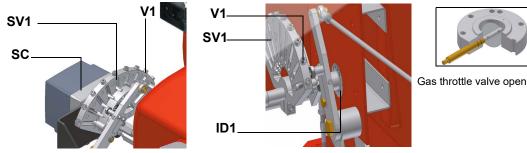

- 9 Drive the burner to high flame stage (please refer to the LMVx documentation attached to this manual).
- 10 To adjust the air flow rate in the high flame stage, loose the RA nut and screw VRA as to get the desired air flow rate: moving the rod TR towards the air damper shaft, the air damper opens and consequently the air flow rate increases, moving it far from the shaft the air damper closes and the air flow rate decreases.

Note: once the procedure is perfomed, be sure that the blocking nut RA is fasten. Do not change the position of the air damper rods.

- 11 If necessary, adjust the combustion head position (see the dedicated paragraph).
- 12 The air and gas rate are now adjusted at the maximum power stage, go on with the point to point adjustement on the SV1 (FGR side) adjusting cam as to reach the minimum output point.
- 13 Procedere, ora, alla regolazione dei pressostati.Now adjust the pressure switches.

- 14 If necessary, adjust the combustion head position (see the dedicated paragraph)...
 - Attention! if it is necessary to change the head position, repeat the air and gas adjustments described above.
- 15 The air and gas rate are now adjusted at the maximum power stage, go on with the point to point adjustement on the SV1 (gas side) adjusting cam as to reach the minimum output point.
- 16 as for the point-to-point regulation, move the gas low flame microswitch a little lower than the maximum position (90°);
- 17 set the **TAB** thermostat to the minimum in order that the actuator moves progressively towards the low flame position;
- 18 move the gas low flame microswitch to the minimum to move the actuator towards the low flame until the two bearings find the adjusting screw that refers to the lower position: screw V1 to increase the rate, unscrew to decrease.

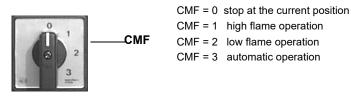

Gas throttle valve closed

- 19 Move again the gas low flame microswitch towards the minimum to meet the next screw on the adjusting cam and repeat the previous step; go on this way as to reach the desired low flame point.
- 20 Now adjust the pressure switches.

Fully-modulating burners

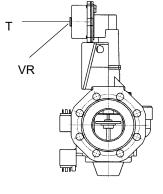

.To adjust the fully-modulating burners, use the **CMF** switch on the burner control panel (see next picture), instead of the **TAB** thermostat as described on the previous paragraphs about the progressive burners. Go on adjusting the burner as described before, paying attention to use the CMF switch intead of **TAB**.

The **CMF** position sets the oprating stages: to drive the burner to the high-flame stage, set CMF=1; to drive it to the low-flame stage, set CMF=2.

Gas valves Siemens VGD - Version with SKP2.(provided with pressure stabilizer).

To increase or decrease gas pressure, and therefore gas flow rate, remove the cap **T** and use a screwdriver to adjust the regulating screw **VR**. Turn clockwise to increase the flow rate, counterclockwise to reduce it.

Calibration air and gas pressure switches

The **air pressure switch** locks the control box if the air pressure is not the one requested. If it happens, unlock the burner by means of the control box unlock pushbutton, placed on the burner control panel.

The **gas pressure switches** check the pressure to avoid the burner operate when the pressure value is not in the requested pressure range.

Calibration of low gas pressure switch

With the burner operating at maximum power, increase the regulation pressure by slowly turning the control knob clockwise until the burner stops, taking care it does not go into lockout and the display shows the error "**Err c20 d0**". As for the gas pressure switch calibration, proceed as follows:

- Be sure that the filter is clean.
- Remove the transparent plastic cap.
- While the burner is operating at the maximum output, test the gas pressure on the pressure port of the minimum gas pressure switch.
- Slowly close the manual cutoff valve (placed upstream the pressure switch, see gas train installation diagram), until the detected
 pressure is reduced by 50%. Pay attention that the CO value in the flue gas does not increase: if the CO values are higher than the
 limits laid down by law, slowly open the cutoff valve as to get values lower than these limits.
- Check that the burner is operating correctly.
- Clockwise turn the pressure switch adjusting ring nut (as to increase the pressure value) until the burner stops.
- Slowly fully open the manual cutoff valve.
- Refit the transparent plastic cover on the pressure switch.

Calibration the maximum gas pressure switch (when provided)

To calibrate the maximum pressure switch, proceed as follows according to its mounting position:

- remove the pressure switch plastic cover;
- if the maximum pressure switch is mounted upstreaam the gas valves: measure the gas pressure in the network, when flame is off; by means of the adjusting ring nut **VR**, set the value read, increased by the 30%.
- if the maximum pressure switch is mounted downstream the "gas governor-gas valves" group and upstream the butterfly valve: light the burner, adjust it according to the procedure in the previous paragrph. Then, measure the gas pressure at the operating flow rate, downstream the "gas governor-gas valves" group and upstream the butterfly valve; by means of the adjusting ring nut VR, set the value read on step 2, increased by the 30%;
- replace the plastic cover.

Calibration of air pressure switch

To calibrate the air pressure switch, proceed as follows:

- Remove the transparent plastic cap.
- Once air and fuel setting have been accomplished, startup the burner.
- During the pre-purge phase o the operation, turn slowly the adjusting ring nut VR in the clockwise direction (to increase the adjusting pressure) until the burner lockout, then read the value on the pressure switch scale and set it to a value reduced by 15%.
- Repeat the ignition cycle of the burner and check it runs properly.
- Refit the transparent plastic cover on the pressure switch.

Calibration gas leakage pressure switch (PGCP)

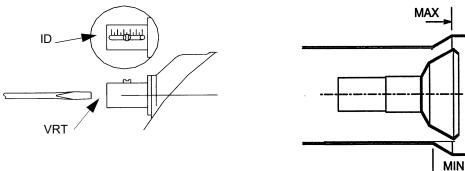

- remove the pressure switch plastic cover;
- adjust the PGCP pressure switch to the same value set for the minimum gas pressure switch;
- replace the plastic cover.

Adjusting the combustion head

Attention! if it is necessary to change the head position, repeat the air and fuel adjustments described above.

Regulating the combustion head

The burner is factory-adjusted with the combustion head in the "MAX" position, accordingly to the maximum power. To operate the burner at a lower power, progressively shift back the combustion head, towards the "MIN" position, screwing the screw **VRT**. The ID index shows how much the combustion head moved.

CAUTION: perform these adjustments once the burner is turned off and cooled.

WARNING: please read carefully the paragraph "Fuel" at the beginning of this manual.

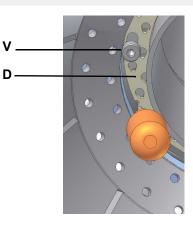

Center head holes gas flow regulation for C120A burner with LPG

To adjust the gas flow, partially close the holes, as follows:

- 1 loosen the three **V** screws that fix the adjusting plate **D**;
- 2 insert a screwdriver on the adjusting plate notches and let it move CW/CCW as to open/close the holes;
- 3 once the adjustmet is performed, fasten the V screws.

CAUTION: Carry out these operations after switching off and allowing the burner to cool down.

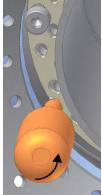

opened holes

The adjusting plate correct position must be regulated in the plant during the commissioning. The factory setting depends on the type of fuel for which the burner is designed:

For LPG burners, plate holes are opened about 1.4mm

The factory calibration depends on the type of fuel for which the burner is designed:

closed holes

ADJUSTMENT PROCEDURE FOR LIGHT OIL OPERATION

The oil flow rate can be adjusted choosing a nozzle that suits the boiler/utilisation output and setting the delivery and return pressure values according to the ones quoted on the following charts.

| NOZZLE | NOZZLE SUPPLY PRESSURE bar | HIGH FLAME RETURN PRESSURE bar | LOW FLAME RETURN PRESSURE bar |
|-------------|----------------------------------|--------------------------------------|-------------------------------------|
| MONARCH BPS | 20 | See table below | See table below |

Tab. 1 - Monarch nozzle

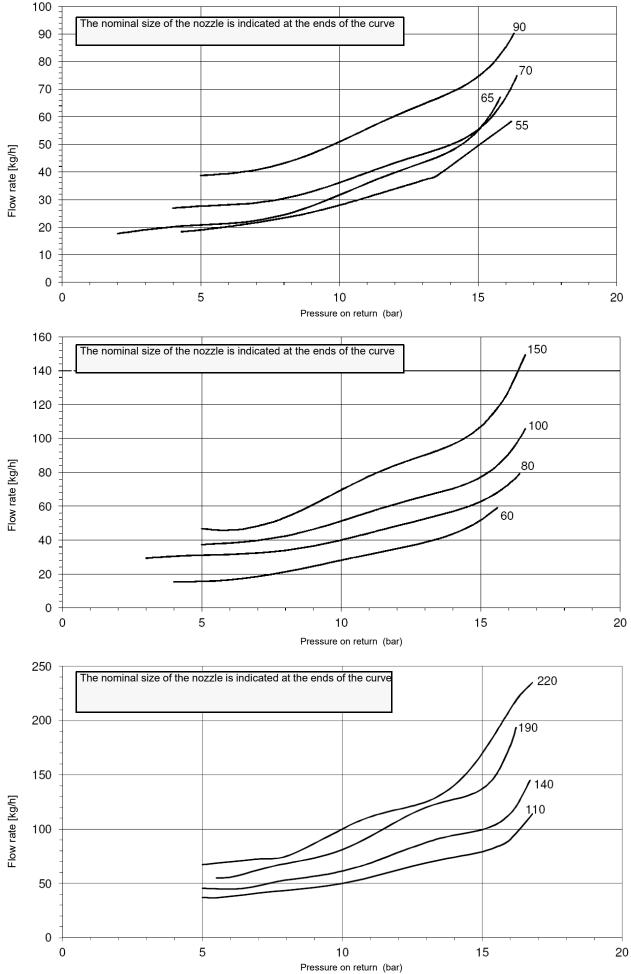

N.B. Specific gravity of the light oil: 0.840kg/dm³

Example: If the nozzle provided is mod. MONARCH 10.5 GPH, when the return pressure is about 13.80bar, the flow rate will be 35.5kg/h. If the return pressure is 8.3bar (with the same nozzle), the flow rate value will be 20.7kg/h. The flow rate in the High-flame operation is related to the nozzle provided with close return. The flow rate in the Low-flame operation can be adjusted by means of the manual pressure regulator, taking care no to go under 8bar.

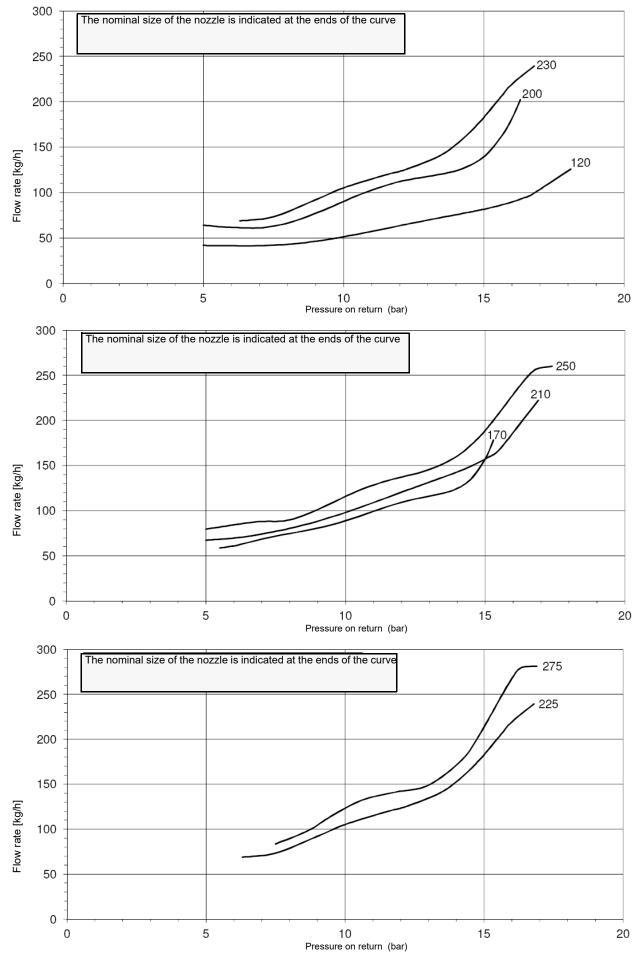

FLUIDICS KW3...45° NOZZLE SUPPLY PRESSURE = 20 bar. VISCOSITY AT NOZZLE = 5 cSt

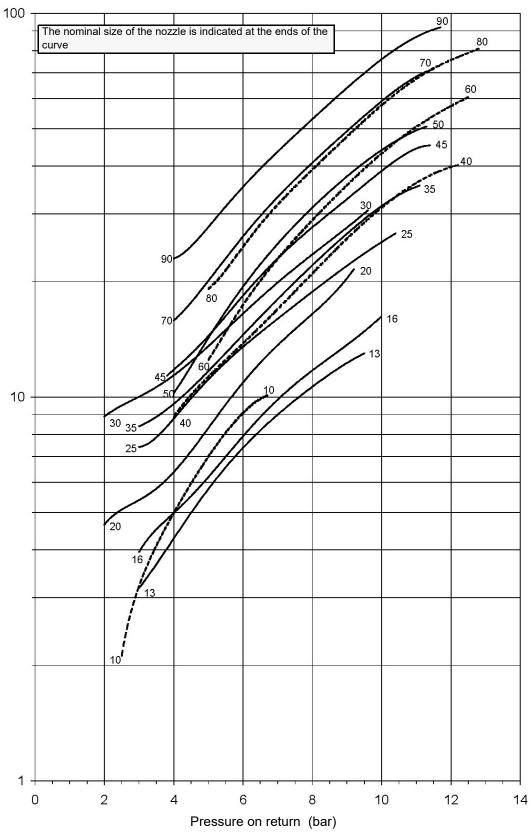

FLUIDICS KW3...45° NOZZLE SUPPLY PRESSURE = 20 bar. VISCOSITY AT NOZZLE = 5 cSt

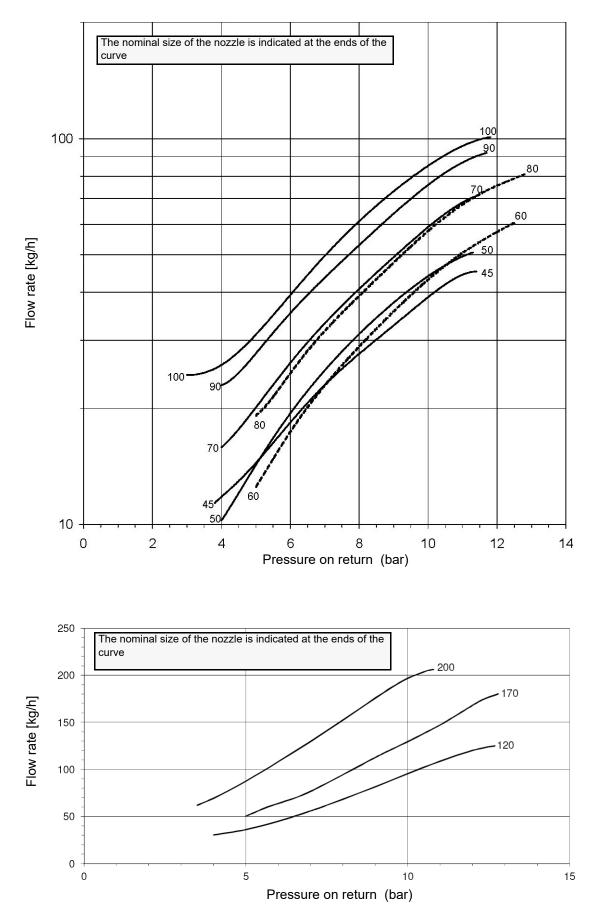

FLUIDICS KW3...60°

NOZZLE SUPPLY PRESSURE = 20 bar. VISCOSITY AT NOZZLE = 5 cSt

Flow rate [kg/h]

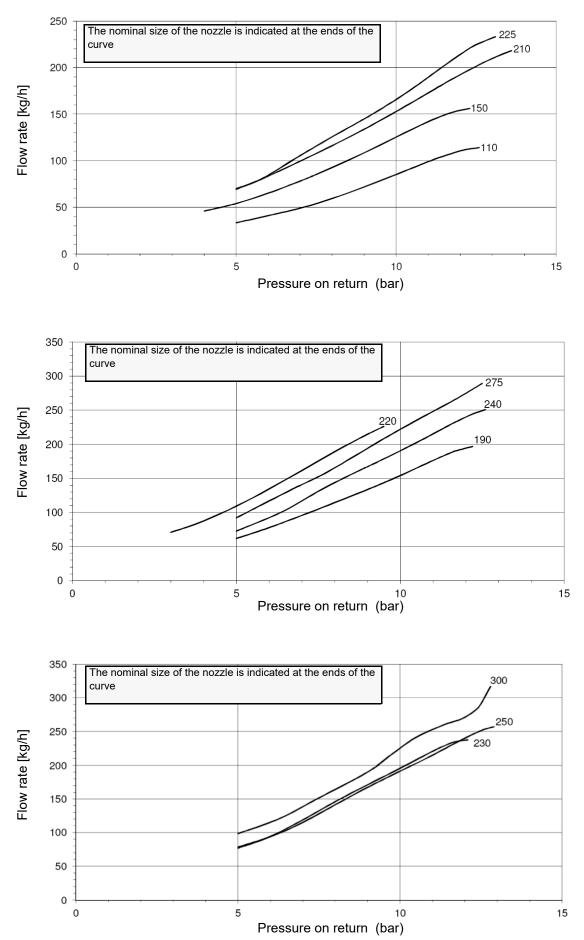

FLUIDICS KW3...60°

NOZZLE SUPPLY PRESSURE = 20 bar. VISCOSITY AT NOZZLE = 5 cS

FLUIDICS KW3...60°

NOZZLE SUPPLY PRESSURE = 20 bar. VISCOSITY AT NOZZLE = 5 cSt

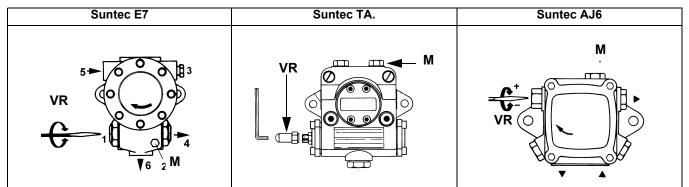

Progressive burners

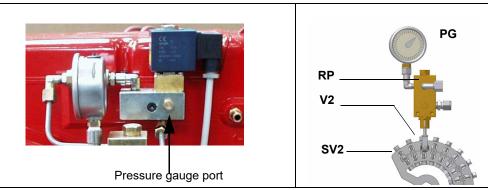

- 1 Once the air and gas flow rates are adjusted, turn the burner off, switch to the oil operation (OIL, on the burner control panel).
- 2 with the electrical panel open, prime the oil pump acting directly on the related **CP** contactor (see next picture): check the pump motor rotation and keep pressing for some seconds until the oil circuit is charged;

3 bleed the air from the **M** pressure gauge port by loosing the cap without removing it, then release the contactor.

- 4 Before starting the burner up, drive the high flame actuator microswitch matching the low flame one (in order to let the burner operates at the lowest output) to safely achieve the high flame stage.
- 5 Start the burner up by means of the thermostat series and wait until the pre-purge time comes to an end and that the bruner starts up;
- 6 drive the burner to high flame stage, by means fo the thermostat **TAB** (as far as fully-modulating burners, see the related paragraph).
- 7 Then move progressively the microswitch to higher values until it reaches the high flame position; always check the combustion values and eventually adjusting the oil pressure (see next step).

- 8 Only if necessary, adjust the supply pressure as follows; insert a pressure gauge into the port shown on figure and act on on the pump adjusting screw **VR**. Pressure values are indicated at the beginning of this paragraph.
- 9 in order to get the maximum oil flow rate, adjust the pressure (reading its value on the PG pressure gauge) without changing the air flow rate set during the gas operation adjustments (see previous paragraph): checking always the combustion parameters, the adjustment is to be performed by means of the SV2 adjusting cam screw (see picture) when the cam has reached the high flame position.
- 10 once the oil rate is adjusted at the maximum output (the air rate was adjusted in the gas regulation), go on with the point to point adjustment on the **SV2** (light oil side) adjusting cam as to reach the minimum output point, as described on the next steps.
- 11 as for the point-to-point regulation, move the gas low flame microswitch a little lower than the maximum position (90°);
- 12 set the **TAB** thermostat to the minimum in order that the actuator moves progressively towards the low flame position (as far as fully-modulating burners, see the related paragraph);
- 13 move the low flame cam to the minimum to move the actuator towards the low flame until the two bearings find the adjusting screw that refers to the lower position: screw **V2** to increase the rate, unscrew to decrease.
- 14 Move again cam III towards the minimum to meet the next screw on the adjusting cam and repeat the previous step; go on this way as to reach the desired low flame point.
- 15 The low flame position must never match the ignition position that is why the cam must be set 20°- 30° more than the ignition position.

Turn the burner off; then start it up again. If the adjustment is not correct, repeat the previous steps.

16

Fully-modulating burners

.To adjust the fully-modulating burners, use the **CMF** switch on the burner control panel (see next picture), instead of the **TAB** thermostat as described on the previous paragraphs about the progressive burners. Go on adjusting the burner as described before, paying attention to use the CMF switch intead of **TAB**.

The **CMF** position sets the oprating stages: to drive the burner to the high-flame stage, set CMF=1; to drive it to the low-flame stage, set CMF=2.

Maximum oil pressure switch

The oil pressure switch on the return line, checks that the pressure does not exceed a default value. This value must not be higher than the maximum acceptable pressure on the return line (this value is reported on the specification table). A pressure change on the return line could affect the combustion parameters: for this reason, the pressure switch must be set, say, at 20% over the pressure recorded during the combustion adjustment. The factory setting is 4 bar.

It is recommended to verify that the combustion parameters are within the range of acceptable values even against a pressure variation that gets close to the limit of the pressure switch.

This check should be carried out along the whole range of the burner output.

In case of inacceptable values, reduce from 20% to 15% the overpressure; later on, repeat the adjustments described above.

Minimum oil pressure switch (when provided)

The minimum oil pressure switch on the inlet line, checks that the pressure does not drop below a default value. The pressure switch must be set, say, at 10% under the pressure at the nozzle.

Oil pressure switch adjustment

Follow the below instruction, according to the pressure switch installed.

Trafag Picostat 9B4..

PART IV: MAINTENANCE

At least once a year carry out the maintenance operations listed below. In the case of seasonal servicing, it is recommended to carry out the maintenance at the end of each heating season; in the case of continuous operation the maintenance is carried out every 6 months.

WARNING: ALL OPERATIONS ON THE BURNER MUST BE CARRIED OUT WITH THE MAINS DISCONNECTED AND THE FUEL MANAUL CUTOFF VALVES CLOSED!

ATTENTION: READ CAREFULLY THE "WARNINGS" CHAPTER AT THE BEGINNIG OF THIS MANUAL.

ROUTINE MAINTENANCE

- Check that the gas meter is not moving when the burner is off. In case it is rotating, look for possible leaks.
- Check that all parts in contact with combustive air (air box, protection mesh and Archimedean screw) are clean and free from any obstruction that might impede free afflux. Clean it with compressed air if available and/or a dry brush or cloths. Eventually wash it with non corrosive detergents.
- Check of blast tube; it must be substituted in case of obvious cracks or anomalous holes. Slight deformations that do not affect combustion may be tolerated
- Check and clean the cartdrige of the fuel filter, replace it if necessary;
- carefully check the fuel flexible hoses for leaks;
- check and clean the filter on the fuel pump: bilter must be thoroughly cleaned at least once in a season to ensure correct working of the fuel unit. To remove the filter, unscrew the four screws on the cover. When reassemble, make sure that the filter is mounted with the feet toward the pump body. If the gasket between cover and pump housing should be damaged, it must be replaced;
- remove, check and clean the combustion head;
- check the ignition electrodes and their ceramic insulators, clean, adjust and replace if necessary;
- remove and clean the oil nozzles (IMPORTANT: do not clean the nozzles using metallic or sharp utensils, use only solvents or steam); at the end of maintenance operations, refit the burner, turn it on and check the combustion. If in doubt, replace the defective nozzle/s. In case of intensive use of the burner, the nozzles must be replaced at the end of the working season;
- examine and clean the detection electrode/photoelement (according to the burner models), replace it if necessary, in case of doubt, check the detection circuit, after the burner start-up;
- clean and grease levers and rotating parts.
- At least every 2 months, or more often if needed, clean the room where the burner is installed.
- Avoid leaving installations, papers, nylon bags, etc., inside the room. They could be sucked by the burner and cause malfunctioning.
- Check that the room's vents are free from obstructions.

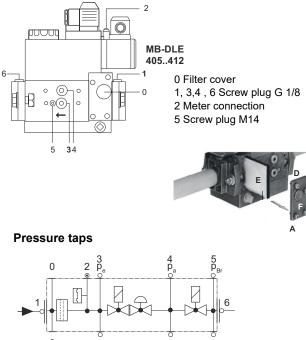

DANGER! Incorrect motor rotation can seriously damage property and injure people. ATTENTIONwhen servicing, if it was necessary to disassemble the gas train parts, remember to execute the gas proving test, once the gas train is reassembled, according to the procedure imposed by the law in force.

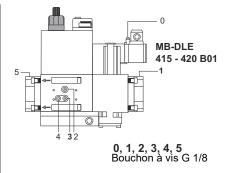

Gas filter maintenance

WARNING: Before opening the filter, close the manual cutoff valve downstream the filter and bleed the gas; check that inside the filter there is no pressurised gas.

Per pulire o sostituire il filtro gas procedere nel modo seguente:

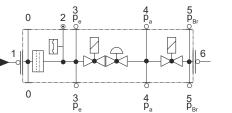

Pressure taps

0

2 p Ĵ p

- Check the filter at least once a year!
- Change the filter if the pressure difference between pressure connection 1 and 3 (Fig. 1-Fig. 3) is $\Delta p > 10$ mbar.
- Change the filter if the pressure difference between pressure connection 1 and 3 (Fig. 1-Fig. 3) is twice as high • compared to the last check.

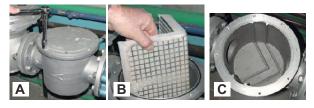

You can change the filter without removing the fitting.

- Interrupt the gas supply closing the on-off valve. 1
- 2 Remove screws 1 ÷ 4 using the Allen key n. 3 and remove filter cover 5 in Fig. 5.
- 3 Remove the filter 6 and replace with a new one.
- 4 Replace filter cover 5 and tighten screws 1 ÷ 4 without using any force and fasten.
- 5 Perform leakage and functional test, p_{max} = 360 mbar.

To clean or remove the filter, proceed as follows:

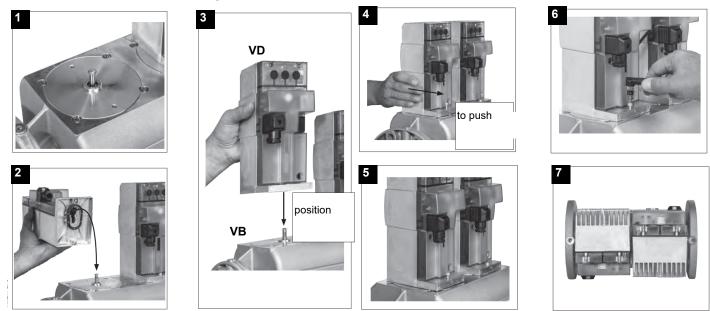

- 1 remove the cap unscrewing the fixing screws (A);
- 2 remove the filtering cartridge (B), clean it using water and soap, blow it with compressed air(or replace it, if necessary)
- 3 replace the cartridge in its proper position taking care to place it inbetween the guides as not to hamper the cap replacement;

be sure to replace the "O" ring into its place (C) and replace the cover fastening by the proper screws (A).

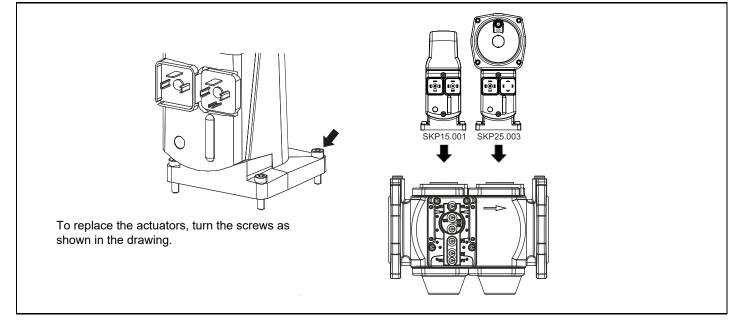

48

MultiBloc VD-V VD-R Mounting

- 1. Position VD on VB, fig. 2+3.
- 2. Slide VD forward up to the stop, fig. 4.
- 3. Screw VD on with 2 M5 screws for each, max. 5 Nm/44 in.-lb., fig. 5/6.
- 4. VD can be mounted rotated by 180°, fig. 7.

Siemens SKP15 e SKP25 Mounting

Thecnical procedure of self cleaning filters substitution (valid for all models)

- 1 Close the bowl valve before the self cleaning filter
- 2 Switch off any electrical equipment on board on the filter (example motorization or heaters)

WARNING! Drain the system by unscrewing the drain screw on the bottom of the self cleaning filter

- 3 Disconnect the outlet pipe from the cover of the self cleaning filter
- 4 Remove the cover with all the filter pack, leaving only the bowl on the line
- 5 Clean any residue on the bottom of the bowl and clean the seat of the O-ring seal

WARNING! Replace the O-ring seal between the bowl and cover

6 Insert the filter pack again making sure to respect the correct inlet/outlet direction or any references on the cover and tray

7 Replace the filter by following the reverse order operations

8 Make sure there is no leakage and give the power to any electrical equipmente on the filter

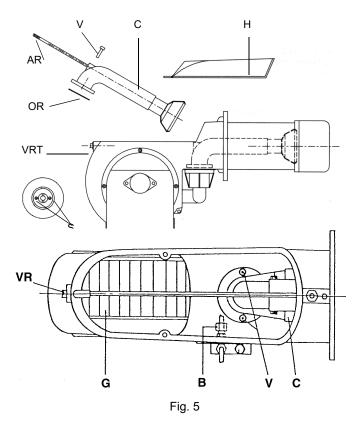

Removing the combustion head

- Remove the top H.
- Slide the UV detector from its housing.
- Unscrew the two screws S holding in position the washer and then unscrew VRT to free the threaded rod AR.
- Slacken the screws V holding the gas manifold C, slacken the connectors B and remove the complete assembly as shown in Fig. 4.

Note: for the subsequent assembly carry out the above described operations in the reverse order, checking the correct position of the OR ring.

Key

- V Fixing screws group C
- C Gas manifold
- B Connecting nut light oil pipes
- G Fan
- VR Head regulating screw

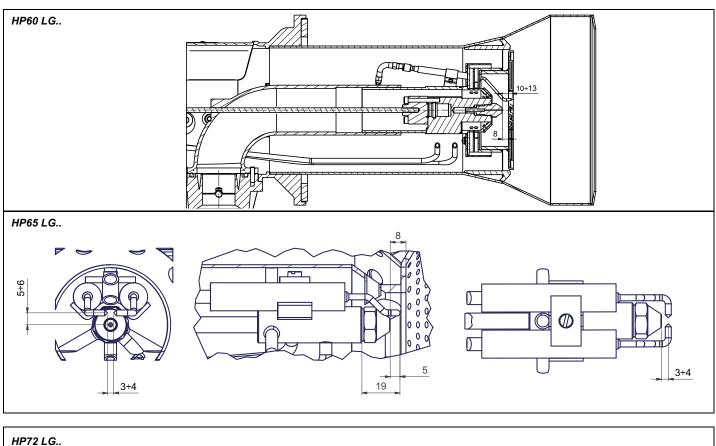

Electrodes Adjustment (LPG burners)

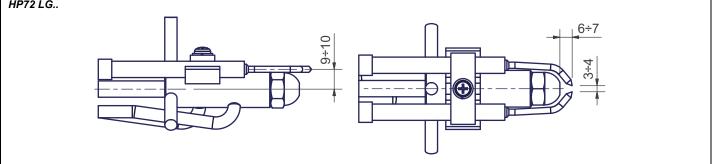

Important Note: Check the ignition and detection electrodes after removing/adjusting the combustion head.

ATTENTION: avoid the ignition and detection electrodes to contact metallic parts (blast tube, head, etc.), otherwise the boiler's operation would be compromised. Check the electrodes position after any intervention on the combustion head.

Adjust the electrodes position, according to the quotes shown othe next picture.

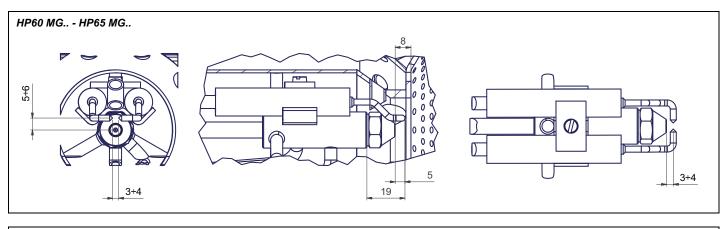

Electrodes Adjustment (natural gas burners)

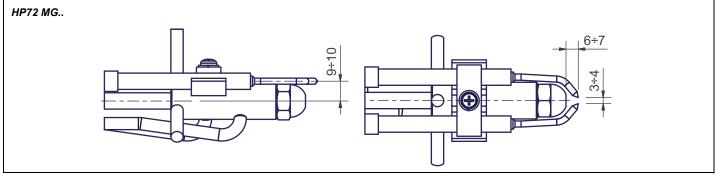

Important Note: Check the ignition and detection electrodes after removing/adjusting the combustion head.

ATTENTION: avoid the ignition and detection electrodes to contact metallic parts (blast tube, head, etc.), otherwise the boiler's operation would be compromised. Check the electrodes position after any intervention on the combustion head.

Adjust the electrodes position, according to the quotes shown othe next picture.

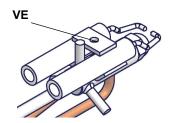

Cleaning/replacing the electrodes

ATTENTION: avoid the electrodes to get in touch with metallic parts (blast tube, head, etc.), otherwise the boiler operation would be compromised. Check the electrodes position after any intervention on the combustion head.

To clean/replace the electrodes, proceed as follows:

- 1 remove the combustion head as described in the previous paragraph;
- 2 remove the electrodes ass.y and clean them;
- 3 in order to replace the electrodes, unscrew the **VE** fixing screws and remove them: place the new electrodes being careful to observe the measures in the previous paragraph; reassemble the electrodes and the combustion head following the reversed procedure.

Checking the detection current

To check the detection signal follow the scheme in the picture below. If the signal is less than the value indicated, check the position of the detection electrode or detector, the electrical contacts and, if necessary, replace the electrode or the detector.

| Control box | Minimum detection signal |
|--------------|--------------------------|
| Siemens LME7 | 70µA (with UV detector) |

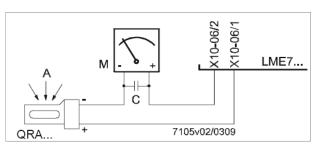

Fig. 6: Detection by photocell QRA..

Burner service term

- In optimal operating conditions, and with preventive maintenance, the burner can last up to 20 years.
- Upon expiry of the burner service term, it is necessary to carry out a technical diagnosis and, if necessary, an overall repair.
- The burner status is considered to be at its limit if it is technically impossible to continue using it due to non-compliance with safety requirements or a decrease in performance.
- The owner makes the decision whether to finish using the burner, or replacing and disposing of it based on the actual state of the appliance and any repair costs.
- The use of the burner for other purposes after the expiry of the terms of use is strictly prohibited.

Flame detection probe

To clean/replace the detection photocell, proceed as follows:

- 1 Disconnect the system from the electrical power supply.
- 2 Shut off the fuel supply;
- 3 remove the photocell from its slot (see next figure);
- 4 clean the bulbe if dirty, taking care not to touch it with bare hands;
- 5 if necessary, replace the bulb;

replace the photocell into its slot.

Seasonal stop

To stop the burner in the seasonal stop, proceed as follows:

- 1 turn the burner main switch to 0 (Off position)
- 2 disconnect the power mains
- 3 close the fuel valve of the supply line

Burner disposal

In case of disposal, follow the instructions according to the laws in force in your country about the "Disposal of materials".

WIRING DIAGRAMS

Refer to the attached wiring diagrams. **WARNING**

- 1 Electrical supply 230V / 400V 50Hz 3N a.c.
- 2 Do not reverse phase with neutral
- 3 Ensure burner is properly earthed

| TROUBLESHOOTING GUIDE Gas operati | on | L |
|--|---|--|
| | * No electric power supply | * Restore power supply |
| | * Main switch open | * Close switch |
| | * Thermostats open | * Check set points and thermostat connections |
| | * Bad thermostat set point or broken thermostat | * Reset or replace the thermostat |
| SURNER DOESN'T LIGHT | * No gas pressure | * Restore gas pressure |
| | * Safety devices (manually operated safety thermostat, pressure switches and so on) open | * Restore safety devices; wait till boiler reaches operatin temperature then check safety device functionality. |
| | * Broken fuses | * Replace fuses. Check current absorption |
| | * Fan thermal contacts open (three phases motors only) | * Reset contacts and check current absorption |
| | * Burner control lock out | * Reset and check its functionality |
| | * Burner control damaged * Gas flow is too low | * Replace burner control |
| | | * Increase the gas flow * Check gas filter cleanness * Check butterfly valve opening when burner is starting (only Hi-Low flame and progressive) |
| GAS LEAKAGE: BURNER LOCKS OUT | * Ignition electrodes discharge to ground because dirty or broken | * Clean or replace electrodes |
| (NO FLAME) | * Bad electrodes setting | * Check electrodes position referring to instruction manual |
| | * Electrical ignition cables damaged | * Replace cables |

LME73.000Ax + PME73.831AxBC LME73.831AxBC

Service instruction manual

M12921CB Rel.1.2 02/2016

GENERAL FEATURES

LME/ is suitable for gas, light and heavy oil burners

LME7 series has two devices: <u>LME73.000</u> (hardware) and <u>PME73.831AxBC</u> (programmable unit). The <u>LME73.831AxBC</u> is also available: it has a built in software and it is a not programmable.

LME7 is inside the control panel. If supplied, PME73.831BC is inside the LME7;

The display AZL23.. or AZL21.. is available for Service and hardware setup.

LME7... are used for the startup and supervision of 2-stage/progressive, modulating forced draft gas burners in intermittent operation.

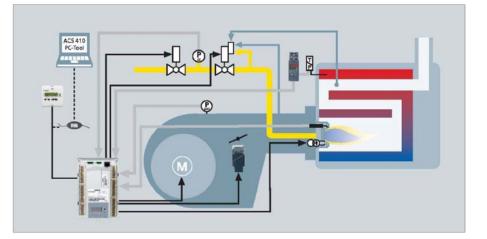

The flame is supervised with an ionization probe, optionally with UV flame detector QRA2..., QRA4.U or QRA10.... Integrated in the LME7... basic unit are:

- Burner control
- BCI
- Control for one actuator
- Lockout reset button (info button)
- 3 multicolor signal lamp LED for operations and fault notifications
- 3 x 7-segment display for service, fault and operating state information
- Interface for program module (no function)

Passwords protect the different parameter levels against unauthorized access. Basic settings that the plant operator can make on site require no password.

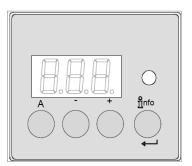

Functions:

- Undervoltage detection
- Electrical remote reset facility
- Accurate control times thanks to digital signal handling
- Multicolor indication of fault status and operating state messages
- Air pressure supervision with function check of air pressure switch during start and operation (gas)
- Repetition limitation
- Controlled intermittent operation after 24 hours of continuous operation*
- BCI
- Indication of program sequence

* after no more than 24 hours of continuous operation, the burner control initiates automatic controlled shutdown followed by a restart.

User interface :

| A | Button A - Display preset output - In lockout position: Power value to the time of fault |
|------------|--|
| | Info and Enter button - Reset in the event of fault, changeover visual diagnostic of the cause of fault (refer to chapter Diagnostics of cause of fault) |
| Ō | button Display flame signal current 2 or phases display In lockout position: MMI phase to the time of fault |
| + | + button - Display flame signal current 1 or phases display - In lockout position: MMI phase to the time of fault |
| \bigcirc | 3 multicolor signal lamp - Refer to chapter "Blink code table" |
| · + | + and - button: Escape function (press + and - simultaneously) No adoption of value One menu level up Keep depressed for >1second for backup / restore function |

First startup when PME is supplied or PME replacement:

First startup:

1) insert a new PME

2) turn the power on; The diplay shows "rst" and "PrC" one after the other.

3) keep pushing the INFO button more than 3 seconds; "run" appears; PME parameters will be transferred to LME 4) at the end, "End" and "rst" appears one after the other; Later (2'), the control box locks out "Loc 138"

5) reset the control box by pressing the INFO is button (for less than 3 seconds) Now the display shows "OFF"; the burner is ready to be started.

Replacement:

- 1) Turn off the burner, replace the existing PME with a new one
- 2) For the first startup, repeat the above procedure, from step 2.

List of phase display on board LME :

| Phase number of 7-segment display | LED | Function |
|--------------------------------------|-----------------------|--|
| Standby | | |
| OFF | Off | Standby, waiting for heat demand |
| P08 | Off | Mains ON / test phase (e.g. detector test) |
| Startup | | |
| P21 | Yellow | Safety valve ON, air pressure switch test / POC test (timeout / locking |
| P22 | Yellow | Fan motor ON / air pressure switch test / settling time |
| P24 | Yellow | Actuator opens in prepurging position |
| P30 | Yellow | Prepurging |
| P36 | Yellow | Actuator closes in ignition load / low-fire position |
| P38 | Yellow blinking | Preignition time |
| P40 | Yellow blinking | 1st safety time (TSA1) / ignition transformer ON |
| P42 | Green | Safety time (ignition transformer OFF), flame check |
| D44 | 0.000 | Interval: End of safety time and fuel valve 1 (V1) ON |
| P44 | Green | Interval: End of safety time and load controller (LR) release |
| P50 Green | P50 Green | 2nd safety time (TSA2) |
| P54 Green | P54 Green | P259.01: Actuator opens in > low-fire |
| P54 Green | P54 Green | P260: Actuator closes in low-fire |
| oP1 Green | oP1 Green | Interval until release of load controller target (analog or 3-position step input) |
| Operation | | |
| oP | Green | Operation, modulating operation |
| Shutdown | | |
| P10 | Yellow | Shutdown, actuator opens in CLOSE position (home run) |
| P72 | Yellow | Actuator opens in high-fire position / end of operation |
| P74 | Yellow | Postpurging |
| Valve proving | | |
| P80 | Yellow | Test space evacuating |
| P81 | Yellow | Checking time fuel valve 1 |
| P82 | Yellow | Test space filling |
| P83 | Yellow | Checking time fuel valve 2 |
| Waiting phases (star | | × · · · · · · · · · · · · · · · · · · · |
| P01 | Red / yellow blinking | Undervoltage |
| P02 | Yellow | Safety loop open |
| P04 | Red / green blinking | Extraneous light on burner startup (timeout / locking after 30 s) |
| P90 | Yellow | Pressure switch-min open |
| Lockout | | |
| LOC | Red | Lockout phase |

Operation:

| nfo J | The lockout reset button (info button) (EK) is the key operating element for resetting the burner control and for activating / deactivating the diagnostics functions. |
|-------------------------------|--|
| Red Vellow Green LED | The multicolor signal lamp (LED) is the key indicating element for visual diagnostics. |

Both lockout reset button (EK) and signal lamp (LED) are located in the control panel. There are 2 diagnostics choices:

1. Visual diagnostics: Indication of operating state or diagnostics of cause of fault

2. Diagnostics: Via internal display or to AZL2.. display and operating unit

Visual diagnostics:

In normal operation, the different operating states are indicated in the form of color codes according to the color code table given below.

Color code table for multicolor signal lamp (LED) :

| State | Color code | Color |
|---|---|-------------------|
| Waiting time (tw), other waiting states | О | OFF |
| Ignition phase, ignition controlled | $\bullet \bigcirc \bullet \bigcirc$ | Blinking yellow |
| Operation, flame o.k. | 0 | Green |
| Operation, flame not o.k. | | Blinking green |
| Extraneous light on burner startup | | Green-red |
| Undervoltage | | Yellow-red |
| Fault, alarm | ▲ | Red |
| Error code output (refer to «Error code table») | | Blinking red |
| Interface diagnostics | | Red flicker light |
| Heating request | • | Yellow |
| Heating request | | Yellow |

Key

| | Steady on |
|---------|------------|
| • | Led off |
| | Led red |
| • | Led yellow |
| | Led green |

| Phase number | Function |
|-----------------|--|
| LOC | Lockout phase |
| OFF | Standby, waiting for heat demand |
| oP | Operation, modulating operation |
| oP1 | Interval until release of load controller target (analog or 3-position step input) |
| 01 | Under voltage |
| 02 | Safety loop open |
| 04 | Extraneous light on burner startup (timeout/locking after 30 seconds) |
| 08 | Mains ON/test phase (e.g. detector test) |
| 10 | Shutdown, actuator opens in CLOSE position (homerun) |
| 21 | Safety valve ON, air pressure switch OFF, actuator opens in CLOSE position |
| 22 | Part 1: Fan motor ON |
| | Part 2: Specified time (t10) air pressure switch (LP) |
| | Message (timeout) stabilization air pressure switch |
| 24 | Actuator opens in prepurge position |
| 30 | Part 1: Prepurge time (t1) without extraneous light test |
| | Valve proving after mains ON, lockout |
| | Part 2: Prepurge time (t1) with extraneous light test |
| 36 | Actuator closes in ignition load |
| 38 | Preignition (t3) |
| 40 | Postignition time (t3n), parameter 257 + 0.3 seconds |
| 42 | Flame detection |
| 44 | Interval (t4): End of safety time (TSA) and burner valve 2 ON |
| 50 | 2nd safety time (t9) |
| 54 | Parameter 259.01: Actuator opens in > low-fire |
| | Parameter 260: Actuator closes in low-fire |
| 72 | End of operation, checking if valve proving (LT) shall be performed |
| 74 | Postpurging (t8) |
| 80 | Test space evacuation (td4) |
| 81 | Test time (td1) fuel valve 1 (V1) |
| 82 | Test space filling (td3) |
| 83 | Test time (td2) fuel valve 2 (V2) |
| 90 | Pressure switch-min open safety shutdown |
| *1 | Valve proving is conducted when |
| | - parameter 241.00 = 1 and parameter 241.02 = 1, or |
| | - parameter 241.00 = 1 and parameter 241.01 = 0 |
| *2 | Valve proving is conducted when |
| | - parameter 241.00 = 1 and parameter 241.02 = 1, or |
| | - parameter 241.00 = 1 and parameter 241.01 = 1 |
| *3 | Valve proving (LT) will not be performed |

Error code table :

| Red blink code of fault signal lamp (LED) | Possible cause |
|---|---|
| 2 x blinks | No establishment of flame at the end of the safety time (TSA) |
| | - Faulty or soiled flame detector |
| | - Faulty or soiled fuel valves |
| | - Poor adjustment of burner, no fuel |
| | - Faulty ignition equipment |
| 3 x blinks | Air pressure switch (LP) faulty |
| | Loss of air pressure after specified time (t10) |
| | - Air pressure switch (LP) welded in no-load position |
| 4 x blinks | Extraneous light on burner startup |
| 5 x blinks | Time supervision air pressure switch (LP) |
| | - Air pressure switch (LP) welded in working position |
| 6 x blinks | Actuator position not reached |
| | - Actuator faulty |
| | - Wrong adjustment of cam |
| | Actuator defective or blocked |
| | - False connection |
| | - Misadjustment |
| 7 x blinks | Too many losses of flame during operation (limitation of repetitions) |
| | Faulty or soiled flame detector |
| | - Faulty or soiled fuel valves |
| | - Poor adjustment of burner |
| 8 x blinks | Free |
| 9 x blinks | Free |
| 10 x blinks | Wiring error or internal error, output contacts, other faults |
| 12 x blinks | Valve proving (LT) |
| | - Fuel valve 1 (V1) leaking |
| 13 x blinks | Valve proving (LT) |
| | - Fuel valve 2 (V2) leaking |
| 14 x blinks | Error in connection with valve closure control POC |
| 15 x blinks | Error code ≥15 |
| | Error code 22: Error of safety loop (SL) |

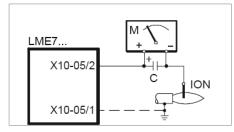

During the time the cause of fault is diagnosed, the control outputs are deactivated: - Burner remains shut down

- External fault indication (AL) at terminal X2-03, pin 3 steady on Diagnostics of cause of fault is quit and the burner switched on again by resetting the burner control. Press the lockout reset button (info button) for about 1 second (<3 seconds).

Flame detection – detection electrode :

| Short-circuit current | Max. AC 1 mA |
|--|-------------------------------------|
| Required detector current | Min. DC 2 µA, display approx. 45 % |
| Possible detector current | Max. DC 3 µA, display approx. 100 % |
| Permissible length of detector cable (laid separately) | 30 m (core-earth 100 pF/m) |

| | | | |

- C Electrolytic condenser 100...470 µF; DC 10...25 V
- M Microammeter Ri max. 5,000 Ω

Warning!

Input QRA... is not short-circuit-proof!

Short-circuits of X10-06/2 against earth can destroy the QRA... input

Simultaneous operation of flame detector QRA... and detection electrode is not permitted

To make certain the age of the UV tube can be determined, the LME7... basic unit must always be connected to mains supply.

Gas proving system :

Valve proving is dependent on input valve proving ON / OFF (X2-02). When a leak is detected, the gas valve proving function ensures that the gas valves will not be opened and that ignition will not be switched on. Lockout will be initiated.

Valve proving with separate pressure switch (P LT)

Step 1: td4 – Evacuation of test space

Gas valve on the burner side is opened to bring the test space to atmospheric pressure.

Step 2: td1 – Test atmospheric pressure

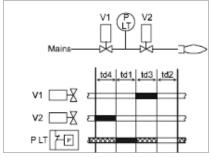

When the gas has closed, the gas pressure in the test space must not exceed a certain level.

Step 3: td3 Filling of test space

Gas valve on the mains side opens to fill the test space.

Step 4: td2 - Test gas pressure

When the gas valve has closed, the gas pressure in the test space must not drop below a certain level.

Controllo tenuta con pressostati separati

Keys

td1 Test atmospheric pressure

td2 Test gas pressure

td3 Filling of test space

td4 Evacuation of test space

V... Fuel valve

PLT Pressure switch valve proving Input / output signal 1 (ON)

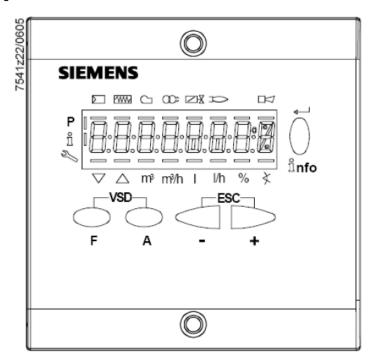

Input / output signal 0 (OFF)

Input permissible signal 1 (ON) or 0 (OFF)

| No. | Parameter |
|-----|--|
| 242 | Valve proving evacuation of test space |
| 243 | Valve proving time test atmospheric pressure |
| 244 | Valve proving filling of test space |
| 245 | Valve proving time test gas pressure |

Instruction, control and modify via AZL2x :

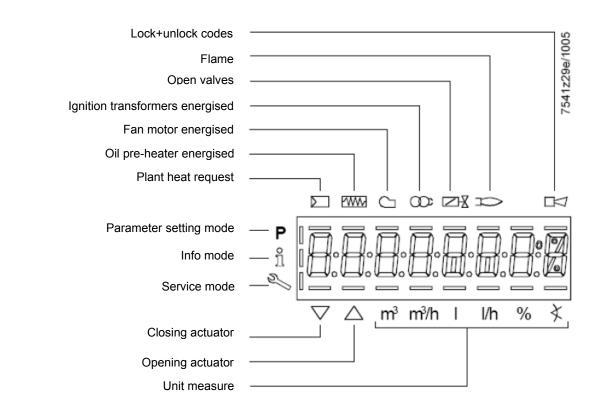

The AZL2x.. display/programming unit is shown below:

The keys functions are the following:

| | Key F + A While pressing the two keys contemporarly, the code message will appear: by entering the proper password it is possible to access the Service mode. |
|---|---|
| r A onumber of the second se | Info and Enter keys Used for Info and Service menues Used as Enter key in the setting modes Used as Reset key in the burner operation mode Used to enter a lower level menu |
| | Key - Used for one menu level down Used to decrease a value |
| + | Key + Used for one menu level up Used to increase a a value |
| - + | Keys (+ & -)= ESC By pressing + and - at the same time, the ESCAPE function is performed No adoption of value One menu level down |

The display will show these data:

While pushing the $\frac{2}{3}$ nfo button together with whatever else button, LME73 locks out; the display shows Ρ ñ \bigtriangleup ٧ h 8 min % ñ On stand-by position, appears h ¥ \triangle ν min s %

On operation, all the phases appears with their number.

List of phase with display AZL2x :

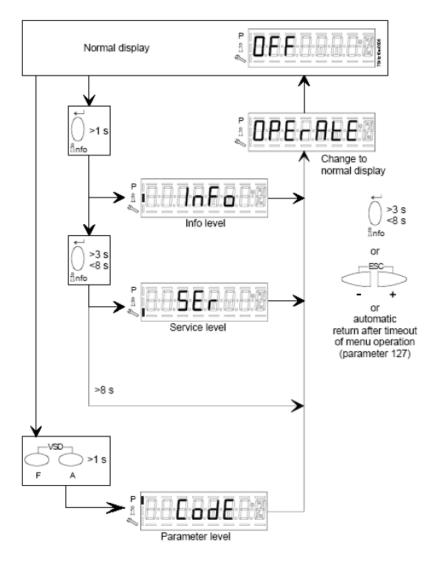

| Phase number | Function |
|--------------------|--|
| Standby | |
| OFF | Standby, waiting for heat request |
| Ph08 | Power ON / test phase (e.g. detector test) |
| Startup | |
| Ph21 | Safety valve ON, air pressure switch test / POC test (timeout / locking after 5 |
| | seconds), actuator opens in low-fire position / CLOSE position |
| Ph22 | Fan motor ON or air pressure switch test / settling time |
| Ph24 | Actuator travels to the prepurge position |
| Ph30 | Prepurging |
| Ph36 | Actuator closes until ignition load / low-fire is reached, and parameter 259.02: |
| | Actuator opens to a position > ignition load |
| Ph38 | Preignition |
| Ph40 | 1st safety time (TSA1) / ignition transformer ON |
| Ph42 | Safety time (ignition transformer OFF), flame check |
| Ph44 | Interval: End of safety time and fuel valve 1 (V1) ON |
| Ph50 | 2nd safety time (TSA2) |
| Ph54 | P259.01: Actuator opens in > low-fire |
| Ph54 | P260: Actuator closes in low-fire |
| oP1 | Interval until release of load controller target (analog or 3-position step input) |
| Operation | |
| oP | Operation, modulating operation |
| Shutdown | |
| Ph10 | Shutdown, actuator opens in CLOSE position (home run) |
| Ph72 | Actuator opens in high-fire position / end of operation |
| Ph74 | Postpurging |
| Valve proving | |
| Ph80 | Test space evacuating |
| Ph81 | Checking time fuel valve 1 |
| Ph82 | Test space filling |
| Ph83 | Checking time fuel valve 2 |
| Waiting phases | |
| (start prevention) | |
| Ph01 | Undervoltage |
| Ph02 | Safety loop open |
| Ph04 | Extraneous light at burner startup (timeout / locking after 30 seconds) |
| Ph90 | Pressure switch-min open \rightarrow safety shutdown |
| Lockout | |
| LOC | Lockout phase |

Error code list with operation via internal AZL :

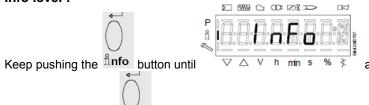

| Error code | Clear text | Possible cause |
|------------|---------------------------------------|--|
| Loc 2 | No establishment of flame at the | - Faulty or soiled fuel valves |
| | end of the safety time (TSA) | - Faulty or soiled flame detector |
| | | Poor adjustment of burner, no fuel |
| | | - Faulty ignition equipment |
| Loc 3 | Air pressure faulty (air pressure | Air pressure switch (LP) faulty |
| | switch (LP) welded in no-load | - Loss of air pressure signal after specified time (t10) |
| | position, decrease to spe-cified time | - Air pressure switch (LP) is welded in no-load |
| | (t10) (air pressure switch (LP) re- | position |
| | sponse time) | Extremente light when human startur |
| Loc 4 | Extraneous light | Extraneous light when burner startup |
| Loc 5 | Air pressure faulty, air pressure | Time out air pressure switch (LP) |
| | switch wel-ded in working position | Air pressure switch (LP) is welded in working position |
| Loc 6 | Fault of actuator | - Actuator faulty or blocked |
| LOC 0 | | - Faulty connection |
| | | - Wrong adjustment |
| Loc 7 | Loss of flame | Too many losses of flame during operation (limitation |
| | E033 Of hame | of repetitions) |
| | | - Faulty or soiled fuel valves |
| | | - Faulty or soiled flame detector |
| | | - Poor adjustment of burner |
| Loc 8 | | Free |
| Loc 9 | | Free |
| Loc 10 | Error not relatable (application), | Wiring error or internal error, output contacts, other |
| | internal error | faults |
| Loc 12 | Valve proving | Fuel valve 1 (V1) leak |
| Loc 13 | Valve proving | Fuel valve 2 (V2) leak |
| Loc 22 | Safety loop open | - Gas pressure switch-max open |
| | | - Safety limit thermostat cut out |
| Loc 138 | Restore process successful | Restore process successful |
| Loc 167 | Manual locking | Manual locking |
| Loc: 206 | AZL2 incompatible | Use the latest version |

Entering the Parameter levels:

y means of a proper use of the keys, it is possible to enter the various level parameters, as shown in the following flow chart :

Info level :

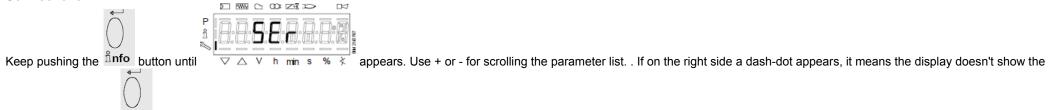

appears. Use + or - for scrolling the parameter list. If on the right side a dash-dot appears, it means the display doesn't show the

full description. Push $\frac{1}{2}$ nfo again for 1 to 3 s in order to show the full description.

Below the visible Info parameters:

| Parameter | Parameter list PME73.000Ax + PME73.831AxBC | Edit | Value | Value range R | | Factory setting | Password level | Password level |

Parameter level (Heating engeneering) :

This level lets the engineer to modify some burner parameters. It is protect with a 4 digit password (SO level) and a 5 digit password (OEM level)

Password input : push **F** and **A** buttons together until the display shows "**code**" and 7 underlines. The left one flashes. By + or - move the flashing underline until it is on the desired position and push "enter". The underline becomes a dash. By means of + or -, choose the right character and push "enter". Input the whole password and the **PArA** appears and later on **000 Int**.

Scroll the parameters using + or -: 000Int, 100, 200, 500, 600 are on the display. Choose the proper parameter group with the enter button and scroll the options with + e poi - (below the full par set: the two columns on the right give the level access). Choose the parameter to be modified with "enter" is writing is allowed. The parameter now flashes: + or - modifies the parameter and enter confirms. + and - pushed togther movbe the menu one step back. Push + and - several times in order to get the home position..

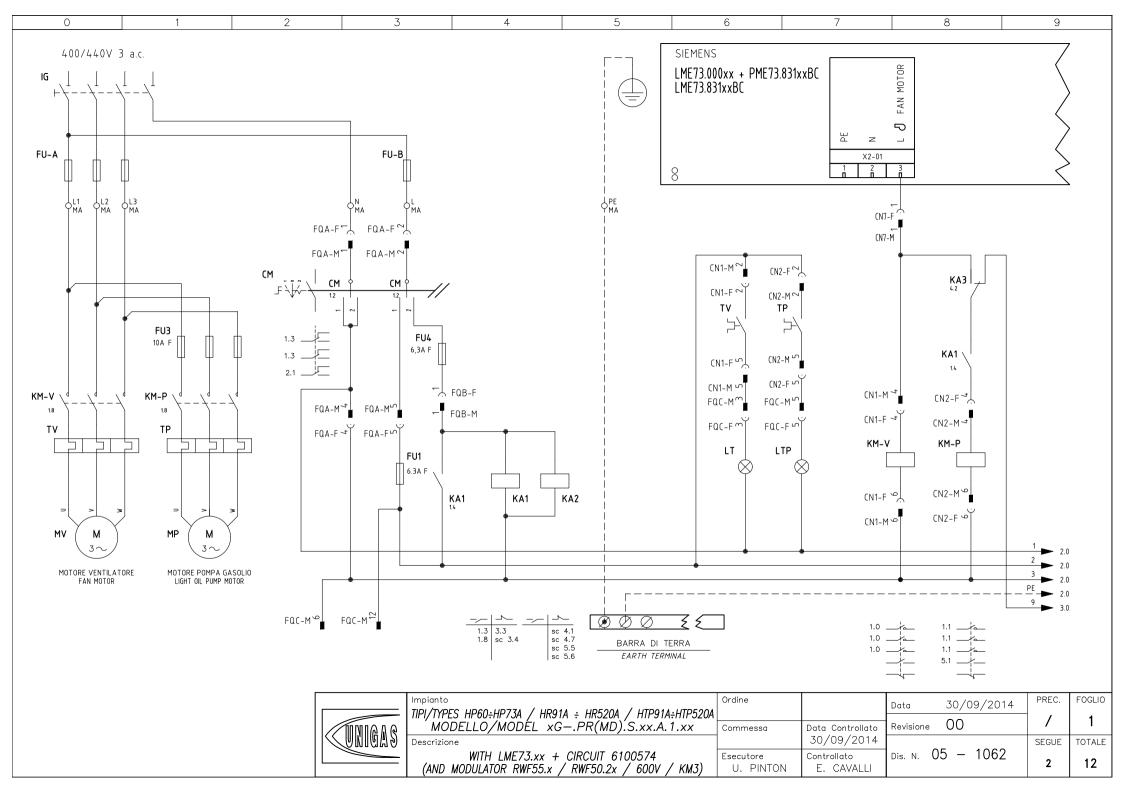

| Parameter | Parameter list PME73.000Ax + PME73.831AxBC | Edit | Value | range | Resolution | Factory setting | Password level | Password level |
